Introduction: The evolutionary mystery of gamete dimorphism	1
PAUL ALAN COX	1
The origin and maintenance of two sexes (anisogamy), and their gamete sizes by gamete competition	17
GEOFF A. PARKER	17
1.1 Introduction	17
1.2 The origin of anisogamy by disruptive selection on gamete size through gamete competition (PBS theory)	18
1.2.1 Mating types and the PBS theory	22
1.2.2 What determines whether the ESS is isogamy or anisogamy?	29
1.2.3 The ancestral isogamous state - which came first, smaller or larger gametes?	35
1.2.4 Requirements for PBS theory	36
1.2.5 Evidence for PBS theory	37
1.3 The loss of motility by female gametes (oogamy)	40
1.4 Other theories for the origin of anisogamy and their relation to gamete competition	41
1.4.1 Classical views	42
1.4.2 Sperm limitation	42
1.4.3 Conflicts with cytoplasmic elements	43

1.5	Stability of anisogamy under internal fertilization - why is anisogamy not lost when sperm competition is reduced?	44
1.5.1	Sperm competition and a direct sperm size-number trade-off	44
1.5.2	No sperm competition: sperm size trade off against mate acquisition or paternal care	48
1.5.3	No sperm competition: sperm numbers increase fertility (sperm limitation)	49
1.5.4	Summary of maintenance of anisogamy	51
1.6	Optimal sizes of the male and female gametes: anisogamy ratios	52
1.6.1	Gamete size dimorphism from PBS theory	52
1.6.2	Optimization of ovum size	54
1.6.3	Sperm competition and the evolution of sperm size	54
1.7	Anisogamy as a stage in the evolutionary chain of sexuality	68
2	The evolutionary instability of isogamy	
	HIROYUKI MATSUDA AND PETER A. ABRAMS	75
2.1	Introduction	75
2.2	Sex-linked model when gamete size is determined independently in each mating type	77
2.3	Non sex-linked model when gamete size is not associated with mating type	83
2.4	Analyses of the sex-linked and non sex-linked models	84
2.5	Cost of sex	86
2.6	Simulation using an individual-based model	87
2.7	Direct effects of size on gamete fitness	88
2.8	Discussion	90
3	Contact, not conflict, causes the evolution of anisogamy	
	JOAN ROUGHGARDEN AND PRIYA IYER	96
3.1	Introduction	96
3.2	Model	99
3.2.1	Hermaphroditic populations	99
3.2.2	Synchronous spawners	101
3.2.3	Genotype 11	101
3.2.4	Genotype 12	102
3.2.5	Frequency dependent collisions	102
3.3	Condition for isogamy	103
3.4	Condition for anisogamy	104

3.5	Ecological predictions and tests	107
3.6	Discussion	108
4	Nucleo-cytoplasmic conflict and the evolution of gamete dimorphism	
	ROLF F. HOEKSTRA	111
4.1	Cytoplasmic selection may cause nucleo-cytoplasmic conflict	111
4.2	The evolution of uniparental cytoplasmic inheritance and anisogamy driven by nucleo-cytoplasmic conflict	112
4.2.1	Empirical evidence: uniparental inheritance	115
4.2.2	Empirical evidence: selfish mitochondrial DNA	116
4.2.3	Evaluation of the theoretical models and comparison of model predictions with empirical evidence	117
4.3	The evolution of isogamous binary mating types	118
4.3.1	The role of nucleo-cytoplasmic conflict in mating-type evolution	119
4.3.2	Mating-type evolution as a consequence of selection for asymmetry in gamete recognition and adhesion	120
4.3.3	Sexual fusion asymmetric from the start?	120
4.3.4	Empirical evidence	121
4.3.5	Mating types superimposed on male/female differentiation	123
4.4	The origin of sexual asymmetry	125
5	Adaptive significance of egg size variation of aquatic organisms in relation to mesoscale features of aquatic environments	
	KINYA NISHIMURA AND NOBORU HOSHINO	131
5.1	Introduction	131
5.2	Turbulent disturbance and its influence on egg size and related traits	134
5.2.1	An integrative view	134
5.2.2	Observed patterns of egg size variation in fish species	135
5.2.3	The model	137
5.2.4	Floating versus demersal	142
5.2.5	Optimal egg size and optimal parental care	142
5.2.6	Optimal early life-stage traits	144
5.2.7	Water turbulent disturbance as an explanatory factor of egg size and related traits	146

5.3	Non-turbulent water movement and egg size	147
5.3.1	Planktonic eggs and larvae in water currents	147
5.3.2	The model	150
5.3.3	Optimal egg size with no retention at the spawning site	154
5.3.4	Optimal egg size and retention at the spawning site	157
5.3.5	Ecological implications	159
5.4	Female gamete size variation in aquatic environments	161
6	Gamete encounters	168
	DAVID B. DUSENBERY	168
6.1	Introduction	168
6.2	Occurrence of sperm limitation	169
6.2.1	Unfertilized eggs	169
6.2.2	Evolved features to avoid sperm limitation	169
6.2.3	Laboratory observations	170
6.2.4	Field surveys	170
6.3	Mechanisms of encounter	171
6.3.1	Gamete encounter rates	171
6.3.2	Factors influencing encounter rates	173
6.4	Predicted evolution of anisogamy	176
6.4.1	Assumptions	176
6.4.2	Selective pressures	181
6.5	Consequences of more effective encounter mechanisms	190
6.6	Questions for the future	191
7	Evolution of anisogamy and related phenomena in marine green algae	194
	TATSUYA TOGASHI AND JOHN L. BARTELT	194
7.1	Introduction	194
7.2	Uniparental inheritance of cytoplasmic genes and gamete size	195
7.3	Gamete size and behavior	196
7.4	Phototaxis and fertilization success	198
7.5	Pheromonal male gamete attraction systems in external fertilizers	200
7.6	Synchronous gamete production and release	202
7.7	Reproductive investment, gamete size and number	204
7.8	Gamete motility	207
7.9	Sex ratio	209
7.10	Dioecious versus monoecious life history	211

7.11 Fertilization kinetics model	211
7.12 Cost of sex	216
7.13 Evolution of gamete size without mating types	218
7.14 Fertilization kinetics and the evolution of anisogamy	223
7.15 Parthenogenesis	232
7.16 Currents and turbulence	233
7.17 Tests of the PBS model	233
7.18 Gamete survival	235
7.19 Anisogamy and habitats	236
7.20 Multicellularity	236
7.21 Summary	237
