

Contents

List of Illustrations	ix
List of Tables	xiii
Preface	xv
1. Introduction	1
Philosophical Musings	2
Explaining Contingency: A Worldview	4
Contingency and Emergence	5
Preparing the Mind for Discovery	7
Structure of the Book	8
2. Conceptualizing Ecosystem Structure	10
Abstracting Complexity	11
Whole System vs. Building Blocks Approach	13
Defining Species Interaction Modules	15
Identifying Interaction Modules in a Grassland Ecosystem	16
Conception of Ecosystem Structure	20
3. Trophic Dynamics: Why Is the World Green?	23
Trophic Control as an Emergent Property of Resource Limitation	24
Explaining Contingency in Trophic Control of Ecosystem Function	26
The Nature of Resource Limitation and Trophic Control of Food Chains	28
The Mechanism Switching Hypothesis of Trophic Control	32
Effects of Herbivore Feeding Mode	36
Collective Effects of Herbivore Species with Different Feeding Modes	38
Plant-Antiherbivore Defense and Strength of Trophic Control	39
Herbivore Resource Selection and Ecosystem Function	41
Stoichiometry and Herbivore Resource Use	42

Resource Selection and Ecosystem Function	43
Herbivore Indirect Effects and Engineering of Green Worlds	46
Herbivore-Mediated Carnivore Indirect Effects on Ecosystems	47
Carnivore Indirect Effects on Plant Diversity	47
Carnivore Indirect Effects on Ecosystem Function	50
4. The Green World and the Brown Chain	55
Conceptualizing Functions along Detritus-Based Chains	56
Resource Limitation and Trophic Control	57
Trophic Control of Decomposition	59
Trophic Control of Mineralization	61
Mechanisms of Top-Down Control	62
Trophic Coupling between Detritus-Based and Plant-Based Chains	64
5. The Evolutionary Ecology of Trophic Control in Ecosystems	68
Carnivore Species and the Nature of Trophic Interactions in an Old-Field System	69
Carnivore Hunting Mode and the Nature of Trophic Interactions	74
The Evolutionary Ecology of Trophic Cascades	86
6. The Whole and the Parts	99
Developing Predictive Theory for Emergence	100
Contingency and Carnivore Diversity Effects on Ecosystems	101
Carnivore Diversity and Emergent Effects on Ecosystem Function	106
Shifting Down One Trophic Level: Intermediate Species Diversity and Ecosystem Function	110
Herbivore Diversity and Mediation of Top-Down Control of Ecosystem Function	112
Detritivore Diversity and Mediation of Top-Down Control of Ecosystem Function	117
The Basal Trophic Level: Plant Diversity and Ecosystem Function	118
Functional Classifications	119
Resource Identity Effects on Trophic Interactions	121
Moving Forward on Functional Diversity and Ecosystem Function	122
7. The Ecological Theater and the Evolutionary Ecological Play	125
Phenotypic Variation and State-Dependent Trade-Offs	127
Attacked Plants Attract Predators	129

Predators That Avoid Predation	130
The Nonconsumptive Basis of Trophic Transfer Efficiencies	132
Trophic Interactions in a Changing Theater	133
Rapid Change in Hunting Strategy	135
Landscapes of Fear and Ecosystem Management	135
Closing Remarks	139
References	143
Index	167

FIGURE 1.1. Hypothetical case in which the relationship between a treatment and response variable is deduced by identifying an average trend among data compiled from numerous, local experiments.	3
FIGURE 2.1. Generic conceptualization of ecosystem structure depicting the live plant-based food chain and the detritus-based food chain that are common among most, but not all, ecosystems.	12
FIGURE 2.2. Hypothetical food web comprised of omnivores, herbivores, and plants illustrating the view that sees the whole system as a collection of food chains subject to might reduce complexity.	23
FIGURE 2.3. Results from field experiments examining the interplay among carnivore, focal herbivore species and plants as illustrate how quantifying interaction strengths of carnivores on herbivores and carnivores on plants can lead to identification of a dominant interaction web that is amenable to experimental analysis of ecosystem functioning in the field.	28
FIGURE 3.1. Extending classic RST theory to explain ecosystem function. Carnivore indirect effects on plant community composition and on ecosystem functions determined by the direct causal chain running from predators, through herbivores, through plant community composition.	25
FIGURE 3.2. Qualitative predictions generated from mechanistic theory of food chain structure in which herbivores face relative and absolute resource limitation.	31
FIGURE 3.3. Results of an experiment that manipulated abiotic conditions and trophic complexity to reveal the nature of trophic control of a grassland ecosystem comprised of herbaceous vegetation, a generalist grass-eater herbivore, and a wolf spider carnivore.	33
