

Table of contents

1. Introduction	1
1.1 The <i>d</i> -block and transition elements	1
1.2 Occurrence of <i>d</i> -block metals	2
1.3 <i>d</i> -Block metals in nature	3
1.4 Gemstones	5
1.5 Diverse experimental observations	5
1.6 Summary	7
1.7 Exercises	7
1.8 Further reading	7
2. Complexes	8
2.1 Introduction	8
2.2 A simple Lewis model of bonding	10
2.3 Ligands	13
2.4 Inner/outer sphere complexes	15
2.5 Polydentate ligands	15
2.6 Stability constants	21
2.7 Chelate effect	22
2.8 The concept of hard and soft acids and bases	24
2.9 Summary	25
2.10 Exercises	26
3. Shape and isomerism	27
3.1 Introduction	27
3.2 Coordination number 1	28
3.3 Coordination number 2	28
3.4 Coordination number 3	29
3.5 Coordination number 4	30
3.6 Coordination number 5	31
3.7 Coordination number 6	32
3.8 Higher coordination numbers	33
3.9 Isomerism	34
3.10 Constitutional isomerism	34
3.11 Stereoisomerism	37
3.12 Summary	40
3.13 Exercises	40

4. Metal classification and electron counting	41
4.1 Introduction	41
4.2 Valence electronic configurations of neutral metals	42
4.3 Oxidation number and electronic configuration	43
4.4 Comparisons of the <i>d</i> -block and <i>f</i> -block metals	44
4.5 Calculation of oxidation number	46
4.6 The covalent bond classification	47
4.7 Electron counting	50
4.8 Electron counting starting from the oxidation number	50
4.9 Electron counting from the CBC	52
4.10 Extending the CBC: equivalent neutral class	53
4.11 Summary	54
4.12 Exercises	55
4.13 Reference	56
5. An ionic model of metal complexes	57
5.1 Introduction	57
5.2 The crystal field theory	57
5.3 The effect of two <i>z</i> -axis electrons on <i>p</i> orbitals	58
5.4 Crystal field description of octahedral complexes	59
5.5 Crystal field splitting for cubic ML_8 and tetrahedral ML_4 complexes	62
5.6 Crystal field splitting for a square planar ML_4 complex	64
5.7 The d^n configurations of octahedral complexes	66
5.8 Tetrahedral complexes	70
5.9 Crystal field theory limitations	71
5.10 Summary	72
5.11 Exercises	72
6. Covalent models of metal complexes	73
6.1 Introduction	73
6.2 A valence bond model: octahedral six-coordination	73
6.3 The molecular orbital approach for σ -bonded ligands	75
6.4 Other geometries	78
6.5 π Donor ligands	79
6.6 π Acceptor ligands	80
6.7 Other π acceptor ligands	83
6.8 Nitrosyl complexes	84
6.9 Phosphine and phosphite complexes	86
6.10 Alkene complexes	89
6.11 The 18-electron rule	91

6.12	The effect of π interactions upon the valence electron count	92
6.13	Metal–metal bonding	94
6.14	Summary	97
6.15	Exercises	97
7.	Consequences of d orbital splitting	98
7.1	Introduction	98
7.2	Spectroscopy and the measurement of Δ_{oct}	98
7.3	Selection rules for d -block metal complexes	99
7.4	The low intensity of the d – d band in $[\text{Ti}(\text{OH}_2)_6]^{3+}$	101
7.5	Charge transfer spectra	101
7.6	Magnetism	102
7.7	Factors affecting the size of Δ_{oct}	104
7.8	Distorted complexes: the Jahn–Teller effect	106
7.9	Periodic consequences of crystal field stabilization energies	110
7.10	Summary	113
7.11	Exercises	114
8.	Formulae and nomenclature	115
8.1	Introduction	115
8.2	Representation of metal complex formulae	115
8.3	Examples of ligand symbols	115
8.4	Nomenclature for metal complexes	116
8.5	Summary	121
8.6	Exercises	122
8.7	Reference	122
	Further reading	123
	Glossary	124
	Index	127
