LIST OF GENERALLY USED SYMBOLS	10
PREFACE	13
1 INTRODUCTION	17
Physics and the chemical or biological action of ionizing radiations	19
Nonlinearity, structure, and hierarchical organization	25
2 GENERALIZED MODEL OF RADIOLYSIS	29
2.1 Formulation of the model	30
The first "picosecond" in radiation chemistry	32
2.2 State-of-matter effects	37
Causality and coherence of events in EMF	39
The dielectric response of condensed matter	41
Nonlinear response of biological dielectrics	44
2.3 Quality-of-radiation effects	48
3 PRIMARY ACTIVATIONS AND THEIR FAST RELAXATIONS	57
3.1 Electronic excitation	61
High Rydberg states of molecules	68
The ion-core model of Rydberg states	71
Relaxation of an isolated Rydberg molecule	72
Generation of high energy Rydberg states of molecules	73
Some implications of HR states in chemistry of high energy radiations	76
3.2 Superexcitation	79
3.3 Direct ionization	85
Interaction of a quantum system with the electromagnetic field	88
Adiabaticity of the charged particle – molecule scattering process	93
The Wannier theory for two or more electrons escaping from a positive ion	99
Excited, and excess-electron excited, states of isolated molecules	104
3.4 State-of-matter effects	107
Useful issues of linear quantum mechanics	111
Electronic excitations in condensed chemical and biological systems	115
Plasmons	119
Excitons	124
Excitons in periodical one-dimensional molecular structures	129
Exciton percolation	134
Solitons	135
Properties of solitons	137

Examples of solitons in biological structures	141
Generation of solitons by high energy radiations	144
Thermalization, reactions and solvation of free electrons in liquids	145
4 INELASTIC SCATTERING OF CHARGED PARTICLES (ELECTRONS) ON ATOMS AND MOLECULES	151
4.1 Collisions of fast charged particles (electrons).	153
4.2 Inelastic scattering spectroscopy of fast electrons	158
4.3 Sum rules and other properties of electronic oscillator strength	161
4.4 Lower limit of validity of the first Bethe-Born approximation and the action of slow electrons	168
5 THE PRIMARY RADIATION CHEMICAL YIELD	171
5.1 Radiation chemical yield	171
5.2 Basic relations of the theory of primary yields	174
5.3 Electron degradation spectrum	177
5.4 Total absorbed energy Q_{tot}	184
5.5 The optical yield	188
5.6 The yield g^s from collisions of slow electrons	189
5.7 Comparison of the two optical approximations to g	193
5.8 Sum rules for the optical oscillator strength and radiation chemical quantities	195
5.9 Primary partition of absorbed energy in mixtures	198
Absorption of energy in composed systems	199
Isolated molecule	201
Mixtures	202
6 THE TRACK OF AN IONIZING PARTICLE IN A DENSE MEDIUM	204
6.1 Basic problems and features of track theories	205
6.2 Chemical track models	210
6.3 Physical track models	212
The MMC model	215
The SB model	216
6.4 The stochastic chemical track model	220
Stochastic versus deterministic treatments of spur evolution	221
6.5 Miscellanea on track models	223
Output data from simplified physical track models as input data for chemical track models	223
Some other track computations	227
Basic problems of degradation spectra and track models	228
7 THEORY, EXPERIMENT, AND PROBLEMS	233
7.1 Gas phase radiolysis	234
Recent data on dipole oscillator strengths and excitation spectra of molecules	234
Radiolysis of molecular hydrogen	237
Primary yields of ions in binary mixtures	240
7.2 Radiolysis of water	243
The comparison between radiolytic decomposition of water vapour and liquid water	245
7.3 Amplification and damping of the primary response	250
7.4 Theory of the radiobiological action	251

7.5 Theoretical foundations of radiation chemistry	255
References	258
The last theoretical word	264
Appendix I	270
Register	276
