About This Book vii

Part I Fundamentals of Dynamic Models

1 Why Do We Model? 3

1.1 Myths of modeling 8

1.2 Types of models 9

1.2.1 Organizational scales 9

1.2.2 Purpose 9

1.2.3 Model endpoint 10

1.2.4 Statistical or mathematical? 10

1.3 Developing your model 11

1.3.1 Steps in model development 11

1.3.2 Advanced applications and topics 16

1.3.3 The rest of the process 20

1.3.4 Modeling is not a linear process 22

2 Introduction to Population Models 25

2.1 Introduction to population dynamics 25

2.2 Fundamental structure of population models 26

2.3 Density-independent models 27

2.3.1 Continuous-time density-independent models 30

2.4 Developing a density-dependent model 31

2.4.1 The logistic model 32

2.4.2 Advanced: Continuous logistic models 34

2.4.3 Other density-dependent models 34

2.4.4 Allee effects 36

2.5 Dynamic behavior of density-dependent models 37

2.6 Cobwebbing 38

2.6.1 Interpreting cobweb diagrams 40

2.6.2 Advanced: What governs dynamic behavior? 43

3 Structured Population Models 47

3.1 Types of population structure: Age versus stage structure 47

3.1.1 An example of age structure 48

3.1.2 An example of stage structure 48

3.1.3 Transient and stable behaviors of structured models 49

3.1.4 Advanced: Deriving recursive equations 50

3.1.5 Advanced: Life-table analysis, reproductive outputs, and Euler's equation 51

3.2 Modeling using matrix notation 52
3.2.1 Why do we bother with matrix representation? 53
3.3 Characteristics of structured models 54
3.4 Elasticity analysis 55
3.4.1 Advanced: How to calculate elasticities 56
3.5 Advanced: Structured density-dependent models 57

4 Competition and Predation Models 61

4.1 Introduction 61
4.1.1 Consider the following two ecological scenarios 61
4.1.2 What does "stability" mean? 61
4.2 Solving for equilibria 62
4.2.1 Continuous-time model 63
4.3 Isocline analysis 64
4.3.1 Continuous-time model 67
4.3.2 Key points 67
4.4 Analytic stability analysis 69
4.4.1 Motivation 69
4.4.2 A brief aside on predator-prey models 69
4.4.3 Background and framework 72
4.4.4 Calculating stability 73
4.4.5 Advanced: Why does the eigenvalue predict stability? 76
4.5 Larger models 80

5 Stochastic Population Models 85

5.1 Introduction 85
5.1.1 What causes stochasticity? 86
5.2 Why consider stochasticity? 87
5.2.1 Reason 1 87
5.2.2 Reason 2 88
5.2.3 So, why aren't all models stochastic? 88
5.2.4 Advanced: Why does stochasticity lower population abundance? 88
5.2.5 Why was the arithmetic mean incorrect? 89
5.3 Density-independent predictions: An analytic result 90
5.3.1 Projecting forward with unknown future stochasticity 91
5.4 Eastern Pacific Southern Resident killer whales 93
5.5 Estimating extinction risk 94
5.5.1 Advanced: Autocorrelation 96
5.6 Uncertainty in model parameters 98
5.7 Density-dependent stochastic models 99
5.7.1 Allee effects 100
5.8 Structured stochastic models 101

Part II Fitting Models to Data

6 Why Fit Models to Data? 105

7 Random Variables and Probability 109

7.1 Introduction 109
7.1.1 What is a random variable? 109
7.2 Binomial 111
7.2.1 Key things about this distribution 111
7.2.2 The probability mass function 111
7.2.3 When would I use this? 111
7.2.4 Properties of the function 112
7.2.5 Example 112
7.3 Poisson 113
7.3.1 Key things about this distribution 113
7.3.2 The probability function 113
7.3.3 When would I use this? 114
7.3.4 Properties of the function 114
7.3.5 Example 114
7.4 Negative binomial 115
7.4.1 Key things about this function 115
7.4.2 When would I use this? 115
7.4.3 The probability function 115
7.4.4 Properties of the function 116
7.4.5 Example 116
7.5 Normal 117
7.5.1 Key things about this distribution 117
7.5.2 When would I use this? 117
7.5.3 The probability density function 117
7.5.4 Properties of the function 118
7.5.5 Example 118
7.6 Log-normal 118
7.6.1 Key things about this distribution 118
7.6.2 When would I use this? 119
7.6.3 The probability density function 119
7.6.4 Properties of the function 119
7.6.5 Example 119
7.7 Advanced: Other distributions 119
7.7.1 The gamma distribution 119
7.7.2 The beta distribution 120
7.7.3 Student's t-distribution 120
7.7.4 The beta-binomial distribution 121
7.7.5 Zero-inflated models 122

8 Likelihood and Its Applications 125

8.1 Introduction 125
8.1.1 Was this a fair coin? 126
8.1.2 Likelihood to the rescue 126
8.1.3 Maximum likelihood estimation 126
8.1.4 What likelihood is not 127
8.2 Parameter estimation using likelihood 128
8.3 Uncertainty in maximum likelihood parameter estimates 130

8.3.1 Calculating confidence intervals using likelihoods 130
8.3.2 To summarize 132
8.3.3 Practice example 1 132
8.4 Likelihood with multiple observations 133
8.5 Advanced: Nuisance parameters 135
8.5.1 What is a likelihood profile? 135
8.5.2 Example 136
8.5.3 The likelihood profile 137
8.6 Estimating parameters that do not appear in probability functions 138
8.6.1 Entanglements of Hector's dolphins 138
8.6.2 Practice example 2 141
8.7 Estimating parameters of dynamic models 142
8.8 Final comments on maximum likelihood estimation 145
8.9 Overdispersion and what to do about it 146

9 Model Selection 149

9.1 Framework 150
9.2 An intuitive method: Cross validation 152
9.3 The Akaike information criterion as a measure of model performance 153
9.3.1 Take-home points 154
9.3.2 Advanced: Theoretical underpinnings of information theory 154
9.3.3 Alternatives to the AIC 156
9.4 Interpreting AIC values 157
9.4.1 Nested versus nonnested 157
9.4.2 Fit to data 159
9.5 Final thoughts 162
9.5.1 Model selection practices to avoid 162
9.5.2 True story 162

10 Bayesian Statistics 165

10.1 Introduction 165
10.1.1 Are you a frequentist or a Bayesian? 165
10.1.2 Wait, what are you talking about? 165
10.1.3 So, how is this different from likelihood? 166
10.2 What is Bayes' theorem, and how is it used in statistics and model selection? 167
10.2.1 Doesn't the prior probability influence the posterior probability? 168
10.3 Practice example: The prosecutor's fallacy 169
10.4 The prior 170
10.4.1 Example: Do people have extrasensory perception? 171
10.4.2 Criticisms 171
10.5 Bayesian parameter estimation 172
10.5.1 How do we do that? 173
10.5.2 Monte Carlo methods 174
10.5.3 Laplace approximation 176
10.5.4 Mechanics of using the prior 177
10.6 Final thoughts on Bayesian approaches 178

Part III Skills

11 Mathematics Refresher 183

11.1 Logarithms 183
11.1.1 Common operations with logarithms 183
11.2 Derivatives and integrals 184
11.3 Matrix operations 185
11.3.1 Dimensions of matrices 185
11.3.2 Adding two matrices 185
11.3.3 Multiplying two matrices 185

12 Modeling in Spreadsheets 187

12.1 Practicum: A logistic population model in Excel 188
12.1.1 Naming spreadsheet cells 189
12.2 Useful spreadsheet functions 190
12.2.1 Exercise 191
12.3 Array formulas 192
12.3.1 Exercise 192
12.4 The data table 192
12.4.1 Exercise 193
12.5 Programming in Visual Basic 194
12.5.1 Creating your own functions in Visual Basic 196

13 Modeling in R 199

13.1 The basics 200
13.1.1 First, some orientation 200
13.1.2 Writing and running R code 200
13.1.3 Statistical functions 203
13.1.4 Basic plotting 204
13.1.5 Data input and output 205
13.1.6 Looping 206
13.1.7 Loops within loops 207
13.2 Practicum: A logistic population model in R 207
13.3 Creating your own functions 209

14 Skills for Dynamic Models 213

14.1 Skills for population models 213
14.1.1 Implementing structured population models 213
14.1.2 Cobwebbing 221
14.2 Skills for multivariable models 223
14.2.1 Calculating isoclines 223
14.2.2 Calculating Jacobian matrices 226
14.3 Monte Carlo methods 229
14.3.1 Monte Carlo example: What is π? 229
14.3.2 Monte Carlo simulation of population models 231
14.3.3 Spreadsheet guidance 232
14.3.4 R guidance 234
14.4 Skills for stochastic models 235
14.4.1 Stochastic models in spreadsheets 235

14.4.2 Stochastic models in R 238
14.4.3 Advanced: Adding autocorrelation 239
14.4.4 Propagating uncertainty 242
14.5 Numerical solutions to differential equations 243
14.5.1 The Euler method 244
14.5.2 The Adams-Bashford method 245
14.5.3 Runge-Kutta methods 246

15 Sensitivity Analysis 251

15.1 Introduction 251
15.1.1 Types of sensitivity analysis 251
15.1.2 Steps in sensitivity analysis 252
15.1.3 Example: Tree snakes 252
15.2 Individual parameter perturbation 255
15.2.1 Quantifying sensitivity 256
15.2.2 Global sensitivity analysis 257
15.3 The Monte Carlo method 258
15.4 Structural uncertainty 262

16 Skills for Fitting Models to Data 263

16.1 Maximum likelihood estimation 263
16.1.1 Maximum likelihood estimation: Direct method 264
16.1.2 Maximum likelihood estimation: Numerical methods 267
16.2 Estimating parameters that do not appear in probability functions 273
16.3 Likelihood profiles 275
16.3.1 Profiles in spreadsheets 276
16.3.2 Profiles in R 277

Part IV Putting It All Together and Next Steps

17 Putting It Together: Fitting a Dynamic Model 283

17.1 Fitting the observation error model 284
17.1.1 Observation error model in spreadsheets 285
17.1.2 Observation error model in R 286
17.1.3 Evaluating fits of the observation error models 287
17.2 Fitting the process error model 288
17.2.1 Process error model in spreadsheets 289
17.2.2 Process error model in R 289
17.2.3 Evaluating fits of the process error models 290
17.3 Parameter estimates and model selection 291
17.4 Can this population exhibit complex population dynamics? 292

18 Next Steps 295

18.1 Reality check 295
18.2 Learn by doing 296
18.2.1 True story 297

Bibliography 298
Index 303
