The second science

1 Simple selection

2 The genetic and ecological context of selection

- 2.1 History, chance, and necessity
- 2.2 The rate of genetic deterioration
- 2.3 The rate of environmental deterioration

3 Natural selection in closed asexual populations

- 3.1 Microcosmologia
- 3.2 Sorting: selection of pre-existing variation
- 3.3 Purifying selection: maintaining adaptedness despite genetic deterioration
- 3.4 Directional selection: restoring adaptedness despite environmental deterioration
- 3.5 Successive substitution
- 3.6 Cumulative adaptation
- 3.7 Successive substitution at several loci

4 Prometheus Unbound: releasing the constraints on natural selection

- 4.1 Increasing the mutation rate
- 4.2 Horizontal transmission
- 4.3 Sex
- 4.4 Dispersal

5 Selection in multicellular organisms

- 5.1 Size matters
- 5.2 Reproductive allocation
- 5.3 Life histories

6 Artificial selection

- 6.1 Selection acting on quantitative variation
- 6.2 Generations 1–10: the short-term response
- 6.3 Generations 10–100: the limits to selection
- 6.4 Generations 100 up: new kinds of creatures
