Preface	ix
Useful data	xi
1 Ideal gases	1
1.1 Thermodynamic variables	1
1.2 Microscopic viewpoint	6
1.3 Ideal gas mixtures	10
Problems	14
2 The first and second laws	17
2.1 Work	17
2.2 Energy conservation: the first law	21
2.3 Entropy and the second law	23
2.4 Boltzmann entropy	27
2.5 Entropy and probability: a macroscopic example	30
2.6 Entropy and probability: a stochastic example	34
Problems	36
3 General applications	39
3.1 Thermodynamic potentials	39
3.2 Heat capacity	44
3.3 Properties of ideal gases	47
3.4 van der Waals' gases	50
3.5 Open systems: enthalpy flux	53
3.6 Latent heat	55
3.7 Turbulent energy fluxes	57
3.8 Potential temperature	60
Problems	63
4 The atmosphere under gravity	67
4.1 Geopotential	67
4.2 Hydrostatic balance	69
4.3 Adiabatic lapse rate	74
4.4 Buoyancy	77

4.5	Dry static energy and Bernoulli function	81
4.6	Statistical mechanics	84
	Problems	89
5	Water in the atmosphere	93
5.1	The Clausius–Clapeyron equation	94
5.2	Calculation of saturated vapour pressure	97
5.3	Humidity variables	100
5.4	Moist static energy	104
	Problems	106
6	Vertical structure of the moist atmosphere	109
6.1	Adiabatic lapse rate for moist air	109
6.2	Entropy budget for saturated air	112
6.3	Finite amplitude instabilities	115
6.4	Vertical structure in thermodynamic diagrams	117
6.5	Convective available potential energy	121
7	Cloud drops	125
7.1	Homogeneous nucleation: the Kelvin effect	125
7.2	Heterogeneous nucleation: the Raoult effect	131
7.3	Köhler theory	132
7.4	Charge-enhanced nucleation	137
7.5	Droplet growth	141
	Problems	151
8	Mixtures and solutions	153
8.1	Chemical potentials	153
8.2	Ideal gas mixtures and ideal solutions	155
8.3	Raoult’s law revisited	158
8.4	Boiling and freezing of solutions	159
	Problems	162
9	Thermal radiation	165
9.1	Thermal radiation and Kirchhoff’s law	165
9.2	The Stefan–Boltzmann and Wien displacement laws	168
9.3	Global energy budget and the greenhouse effect	170
9.4	Horizontal variations	175
9.5	Radiative intensity	177
9.6	Radiative transfer	180
9.7	Radiative-convective equilibrium	185
9.8	Thermodynamics of a photon gas	191
9.9	Derivation of the Planck law	195
	Problems	200

10 Non-equilibrium processes	203
10.1 Energetics of motion	203
10.2 Diabatic effects and the second law	208
10.3 Thermodynamics of forced dissipative systems	213
10.4 Climate thermodynamics	215
Problems	220
Appendix A Functions of several variables	221
Appendix B Exergy and thermodynamic stability	223
Appendix C Thermodynamic diagrams	227
Appendix D Relationship between energy density and energy flux	233
Index	235
