1	Finite element method for elliptic problems	9
1.1	Idea of the finite element method	9
1.1.1	Function spaces	9
1.1.2	Weak formulation of the diffusion equation	13
1.1.3	Abstract variational problem	14
1.1.4	Basic ideas of the finite element method	14
1.1.5	Relation of the finite element method to the finite difference method	15
1.2	Finite element spaces	17
1.2.1	Triangulation of the computational domain	17
1.2.2	General definition of a finite element	18
1.2.3	Examples of finite elements	18
1.2.4	Example of the construction of a finite element space	19
1.2.5	General definition of a finite element space	20
1.2.6	Affine equivalence of finite elements	22
1.3	Error estimates	22
1.3.1	Convergence of Galerkin solutions	22
1.3.2	Basic idea of error estimates in the $H^1(\Omega)$ norm	23
1.3.3	Estimates of the local interpolation error	23
1.3.4	Error estimates in the $H^1(\Omega)$ norm for general finite element spaces	28
1.3.5	Error estimates in the $L^2(\Omega)$ norm	31
1.3.6	Approximation of the forms in the Galerkin discretization	33
1.3.7	Numerical integration	34
2	Convection–diffusion equations and incompressible fluid flow	43
2.1	Upwinding techniques for convection–diffusion equations	43
2.1.1	Galerkin and Petrov–Galerkin methods	44
2.1.2	Tabata’s upwind method	44
2.1.3	Upwinding techniques based on dual meshes	45
2.1.4	The Mizukami–Hughes method	45
2.1.5	The improved Mizukami–Hughes method	47
2.1.6	Numerical results	49
2.2	Stabilized discretizations of convection–diffusion equations	50
2.2.1	SUPG method	50
2.2.2	Nonlinear stabilization methods	53
2.2.3	Numerical results	55
2.3	Solution of incompressible fluid flow problems	60
2.3.1	Weak formulations of the Stokes and Navier–Stokes equations	60
2.3.2	Discretization of the Stokes equations	61
2.3.3	Discretization of the Navier–Stokes equations	62

3	Evolution problems	69
3.1	Notation	69
3.2	Problem setting and weak formulation	70
3.3	Method of lines	71
3.4	One-step methods	73
3.4.1	Euler methods	74
3.4.2	Eigenvalues of the discrete negative Laplace operator in 1D	78
3.4.3	Stability	80
3.4.4	Crank-Nicolson method	81
3.4.5	Runge-Kutta methods	84
3.5	General multistep methods	86
3.5.1	Stability	86
3.5.2	Backward difference formulae	87
3.5.3	Adams methods	91
3.6	Numerical example	92
4	Discontinuous Galerkin finite element method	95
4.1	Introduction	95
4.2	Motivation and notation	96
4.2.1	Motivation	96
4.2.2	Notation	97
4.2.3	Spaces of discontinuous functions	97
4.3	First order hyperbolic problems	98
4.3.1	Continuous problem	99
4.3.2	DG formulation	99
4.3.3	Numerical flux	100
4.3.4	Time discretization	102
4.3.5	Basic properties	102
4.4	DG formulation of second order elliptic terms	103
4.4.1	DG formulation	103
4.4.2	Basic properties	105
4.4.3	Unified approach of Arnold et al.	106
4.5	DG method for ordinary differential equations	108
4.5.1	Problem setting and notation	108
4.5.2	DG formulation	108
4.5.3	Basic properties	109
5	Implementation of FEM and DGM	111
5.1	P^1 solution of the model problem	111
5.1.1	Triangulation	112
5.1.2	Finite element space	112
5.1.3	Discretization	113
5.1.4	Implementation	114
5.1.5	Treatment of general boundary conditions	120
5.2	General FE solution of the model problem	121
5.2.1	Definition of reference elements	121
5.2.2	Evaluation of integrals on the reference element	123
5.2.3	Grids and functional spaces	125
5.2.4	Implementation	126
5.3	Basis and shape functions	127
5.3.1	The reference Lagrangian shape functions	127
5.3.2	The reference Lobatto shape functions	130
5.3.3	Global basis functions on V_h	132

5.4	Discontinuous finite elements	135
5.4.1	DG discretization of the model problem	135
5.4.2	The hp -discontinuous Galerkin method	136
5.4.3	Definition of the DG basis	136
5.4.4	Construction of the DG basis functions	137
5.4.5	Evaluation of volume integrals	138
5.4.6	Evaluation of face integrals	139
5.4.7	Data structures	141
5.5	Numerical quadratures	141
5.5.1	Edge quadratures	141
5.5.2	Quadratures on quadrilaterals	141
5.5.3	Quadratures on triangles	143
5.5.4	Data structure	144
5.6	Basic visualization techniques	144
5.6.1	Types of visualization	144
5.6.2	Software for visualization	145
5.6.3	Visualization of higher order polynomial functions	147
6	Concluding remarks	151
6.1	A posteriori error estimates and adaptive methods	151
6.2	Solution of the resulting algebraic systems	151
6.3	Domain decomposition and parallel computing	152
6.4	Applications	152
	Bibliography	155
