

Table of contents

Author's Introduction	4
Preface	5
Chapter 1: Molecular interactions in biopolymers and natural organic matter: from structural principles to macro-scale effects.....	6
1.1 Humic substances: native transport systems & promising artificial carriers	6
1.1.1 Development of novel methodology for interaction studies based on diffusion processes	6
1.1.2 On the role of carboxylic groups in the binding of amphiphilic substances by humics ..	9
1.1.3 Transport of humic substances through skin and plant cuticle	11
1.1.4 From understanding the natural function to the development of novel application forms.....	12
1.2 Microbial polyesters: what makes their structure in cells so special?	14
1.2.1 Polyhydroxyalkanoates <i>in vivo</i> : staying unfavorable	15
1.2.2 Development of nature-inspired bioplastics with tailorable properties.....	19
Chapter 2: "Physical microbiology": physicochemical support for biotechnology and microbiology	21
2.1 Being stuffed with plastics: polyhydroxyalkanoates in bacteria	21
2.1.1 Biophysical consequences of PHA in cells	22
2.2 Feeling stronger: role of PHA in bacterial stress-response	24
2.3 Another brick in the wall: monomer comes to the scene	28
2.3.1 Protective effects of 3-hydroxybutyrate	28
2.3.2 On the hydration of 3-hydroxybutyrate	28
Chapter 3: Hydrogels: experimental model of biological systems, soft-matter material for future applications.....	30
3.1 Semi-Interpenetrating Polymer Networks: Controlling structure and interactions independently.....	31
3.2 Hydrogels: Multipurpose materials with versatile applications.....	32
3.2.1 Novel multi-purpose hydrosorbents for agricultural uses	32
3.2.2 Encapsulation of microbes in hydrogels.....	34
Afterword	37
