## Preface to the 2003 Printing

Preface . . . . .	xi
Acknowledgments . . . . .	xiii
<b>1. Introduction . . . . .</b>	<b>1</b>
1.1 Aims of theoretical population dynamics . . . . .	1
1.2 Choice of variables . . . . .	2
1.3 Deterministic and stochastic phenomena . . . . .	4
1.4 Cyclic, quasi-cyclic and non-cyclic fluctuations . . . . .	6
1.5 Ecological and mathematical stability . . . . .	10
1.6 Non-linear models . . . . .	13
Sources and suggested further reading . . . . .	15

## PART I DETERMINISTIC MODELS

<b>2. Single-Species Models . . . . .</b>	<b>19</b>
2.1 The fundamental equation . . . . .	19
2.2 Difference and differential equations . . . . .	20
2.3 Scaling and dimensional analysis . . . . .	21
2.4 Deterministic steady states, stability and decay of fluctuations	22
2.5 Systems 'driven' by fluctuating parameters . . . . .	27
A. General principles . . . . .	27
B. An illustrative example . . . . .	29
2.6 Mathematical techniques for analysing driven systems . . . . .	34
A. Complex exponentials . . . . .	34
B. The transfer function . . . . .	35
C. Fourier transforms . . . . .	37
2.7 Delayed regulation . . . . .	39
A. Delayed regulation of the per capita vital rates . . . . .	40
B. Delayed regulation of the population birth rate . . . . .	41
C. Distributed delays . . . . .	42

2.8	Non-linear effects . . . . .	45
	A. Autonomous systems . . . . .	45
	B. Driven systems . . . . .	48
2.9	Comparison of the dynamical properties of models and real populations . . . . .	52
	A. Laboratory populations . . . . .	52
	B. Natural populations . . . . .	53
	Sources and suggested further reading . . . . .	57
	Problems . . . . .	58
<b>3.</b>	<b>Single-Species Models with Age Structure.</b> . . . .	<b>62</b>
3.1	Introduction . . . . .	62
3.2	Population models involving age structure . . . . .	62
	A. Continuous time . . . . .	63
	B. Discrete time . . . . .	65
	C. Elaborations of the basic model . . . . .	67
3.3	Density-dependent population dynamics in an unchanging environment . . . . .	70
	A. Continuous time . . . . .	70
	B. Discrete time . . . . .	74
3.4	The effects of a variable environment . . . . .	75
3.5	Oscillations due to age-structure effects . . . . .	78
	Sources and suggested further reading . . . . .	80
	Problems . . . . .	81
<b>4.</b>	<b>Models of Interacting Species.</b> . . . .	<b>86</b>
4.1	Introduction . . . . .	86
4.2	Neighbourhood stability analysis . . . . .	87
	A. Differential equation model of two interacting species . . . . .	87
	B. Differential equation model of $M$ interacting species . . . . .	90
	C. Difference equation model of $M$ interacting species . . . . .	93
4.3	'Driven' systems . . . . .	95
	A. Two-species differential equation models . . . . .	95
	B. Many-species differential equation models . . . . .	99
	C. Many-species difference equation models . . . . .	100
4.4	Non-linear phenomena . . . . .	100
	A. Global stability analysis . . . . .	100
	B. Limit cycles . . . . .	101
	C. Other non-linear exotica . . . . .	104
4.5	Linear versus non-linear mathematics . . . . .	104
	A. General comments . . . . .	104
	B. An illustrative example . . . . .	104
4.6	Important special classes of multi-species model . . . . .	109
	A. Two-species predator-prey models . . . . .	109
	B. Models of interspecific competition . . . . .	112

Sources and suggested further reading . . . . .	115
Problems . . . . .	116
<b>5. The Effects of Spatial Heterogeneity . . . . .</b>	<b>121</b>
5.1 Introduction . . . . .	121
5.2 Modelling with ordinary differential or difference equations . . . . .	122
A. Searching . . . . .	122
B. Territorial behaviour . . . . .	124
C. Patchy environments . . . . .	127
5.3 Modelling with partial differential equations . . . . .	131
A. Balance equation for population density . . . . .	131
B. Random motion . . . . .	135
C. Biased random motion and directed motion . . . . .	136
D. Boundary conditions . . . . .	137
5.4 Exponentially growing or declining populations . . . . .	138
5.5 Neighbourhood stability analysis for partial differential equation . . . . .	141
A. Local linearization . . . . .	141
B. An example with density-dependence in the vital rates. . . . .	143
C. An example with density-dependent dispersal . . . . .	145
D. Wave-like disturbances . . . . .	147
E. Diffusion as a stabilizing and destabilizing factor . . . . .	150
5.6 Driven systems . . . . .	153
A. A single-species model with density-dependent dispersal . . . . .	153
B. A two-species model with diffusion . . . . .	154
5.7 Spatial competition and long-range dispersal—the need for integro-differential equations . . . . .	156
5.8 Mildly non-uniform steady states—tracking spatial variations in environment . . . . .	158
Sources and suggested further reading . . . . .	161
Problems . . . . .	162

## PART II STOCHASTIC MODELS

<b>6. Birth and Death Processes in a Static Environment . . . . .</b>	<b>167</b>
6.1 Introduction . . . . .	167
6.2 Mathematical representation of non-linear birth and death processes . . . . .	168
A. Discrete probability distributions . . . . .	168
B. Diffusion approximations . . . . .	172
C. Stochastic differential equations . . . . .	176
6.3 Density-independent growth and decline . . . . .	178
6.4 Stationary and quasi-stationary probability distributions . . . . .	183
A. Discrete distributions . . . . .	183

	B. Diffusion approximations . . . . .	184
	C. Locally linear approximations . . . . .	185
6.5	Gross fluctuation characteristics . . . . .	186
	A. Expectation values and time averages . . . . .	187
	B. Direct methods . . . . .	188
	C. Fourier transform methods . . . . .	190
6.6	Extinction . . . . .	192
	A. Exact analytic results . . . . .	193
	B. Extinction and the population probability distribution . . . . .	196
	C. Analytic approximations . . . . .	198
6.7	Worked examples . . . . .	202
	A. A logistic birth and death model . . . . .	202
	B. A model with a lower unstable steady state . . . . .	209
6.8	Population dynamics in patchy environments . . . . .	214
	A. The prototype model . . . . .	216
	B. Robustness . . . . .	217
	Sources and suggested further reading . . . . .	219
	Problems . . . . .	220
<b>7.</b>	<b>Variable Environments . . . . .</b>	<b>225</b>
7.1	Introduction . . . . .	225
7.2	Single-species models with environmental variability . . . . .	226
	A. Exact calculations . . . . .	226
	B. Approximate calculation of gross fluctuation characteristics . . . . .	230
	C. Extinction . . . . .	234
7.3	Environmental stochasticity . . . . .	237
	A. 'Deterministic' and 'random' environmental variation . . . . .	237
	B. Formal representation of environmental stochasticity . . . . .	238
	C. Types of noise . . . . .	240
	D. Local linearization . . . . .	246
	E. Elaborations . . . . .	248
7.4	Quasi-cyclic fluctuations . . . . .	250
	A. Identifying and describing quasi-cycles . . . . .	250
	B. Exogenous quasi-cycles in a damped Lotka–Volterra system . . . . .	256
7.5	Spatially inhomogeneous environmental variability . . . . .	261
	A. Characterization . . . . .	261
	B. Modelling spatially inhomogeneous population fluctuations . . . . .	264
	C. A single species worked example . . . . .	265
	D. A two-species worked example . . . . .	267
7.6	Incorporating non-linearity . . . . .	269
	A. Non-linear stochastic differential equations . . . . .	269
	B. Constructing realizations . . . . .	274
	C. Robustness . . . . .	275
7.7	Overview of stochastic modelling . . . . .	277
	Sources and suggested further reading . . . . .	278
	Problems . . . . .	279

## PART III CASE STUDIES

<b>8. Oscillations in Laboratory Fly Populations</b> . . . . .	285
8.1 Introduction . . . . .	285
8.2 The time-delayed logistic model . . . . .	287
A. Analysis of the model . . . . .	287
B. Testing the model . . . . .	289
8.3 A more realistic model . . . . .	292
A. Formulation of the model . . . . .	293
B. Analysis of the model . . . . .	295
C. Testing the model . . . . .	298
8.4 The qualitative behaviour of the new model . . . . .	302
8.5 Conclusions . . . . .	307
Sources and suggested further reading . . . . .	308
<b>9. Chemostat Populations of Unicellular Algae</b> . . . . .	309
9.1 Introduction . . . . .	309
9.2 Population and nutrient balance in the chemostat . . . . .	311
9.3 Modelling the chemostat . . . . .	312
9.4 Analysis of the basic model . . . . .	313
9.5 Time-delay models . . . . .	317
A. Experimental evidence for a delay . . . . .	317
B. Discrete delay . . . . .	318
C. Distributed delay . . . . .	319
D. Experimental tests . . . . .	319
9.6 Main conclusions . . . . .	321
Sources and suggested further reading . . . . .	322
<b>10. Predator–Prey Quasi-Cycles in a Patchy Environment</b> . . . . .	324
10.1 Huffaker's experiments . . . . .	324
10.2 A discrete-state model . . . . .	328
10.3 Deterministic stability . . . . .	331
10.4 Gross fluctuation characteristics . . . . .	333
A. Theory . . . . .	333
B. Experimental tests . . . . .	336
10.5 Extinction times . . . . .	338
10.6 Conclusions . . . . .	339
Sources and suggested further reading . . . . .	340

## APPENDIXES

<b>Appendix C. Calculus with Functions of Two or More Variables</b> . . . . .	341
<b>Appendix D. The Dirac <math>\delta</math>-Function</b> . . . . .	344

<b>Appendix F. Fourier Analysis</b> . . . . .	347
<b>Appendix M. Matrices</b> . . . . .	354
<b>References</b> . . . . .	361
<b>Author Index</b> . . . . .	371
<b>Subject Index</b> . . . . .	374

  

10.1	Introduction	374
10.2	Population and nutrient balance in the chemostat	375
10.3	Modelling the chemostat	376
10.4	Analysis of the basic model	377
10.5	Time-delay models	378
10.5.1	A. Experimental evidence for a delay	378
10.5.2	B. Discrete delay	379
10.5.3	C. Distributed delay	380
10.5.4	D. Experimental tests	381
10.6	Main conclusions	382
10.7	Sources and suggested further reading	383
11	Predator-Prey Quasi-Cycle in a Patchy Environment	384
11.1	Huffaker's experiments	384
11.2	A discrete-state model	385
11.3	Deterministic stability	386
11.4	Gross fluctuation characteristics	387
11.4.1	A. Theory	387
11.4.2	B. Experimental tests	388
11.5	Extinction times	389
11.6	Conclusions	390
11.7	Sources and suggested further reading	391
12	Stochastic Extinction in a Two-Species System	392
12.1	Introduction	392
12.2	Formulation of the model	393
12.3	Analysis of the model	394
12.4	Testing the model	395
12.5	A more realistic model	396
12.6	Conclusions	397
12.7	Sources and suggested further reading	398
13	Chemostat Population of Unicellular Algae	399
13.1	Introduction	399
13.2	Population and nutrient balance in the chemostat	400
13.3	Modelling the chemostat	401
13.4	Analysis of the basic model	402
13.5	Time-delay models	403
13.5.1	A. Experimental evidence for a delay	403
13.5.2	B. Discrete delay	404
13.5.3	C. Distributed delay	405
13.5.4	D. Experimental tests	406
13.6	Main conclusions	407
13.7	Sources and suggested further reading	408
14	Stochastic Extinction in a Two-Species System	409
14.1	Introduction	409
14.2	Formulation of the model	410
14.3	Analysis of the model	411
14.4	Testing the model	412
14.5	A more realistic model	413
14.6	Conclusions	414
14.7	Sources and suggested further reading	415
15	Chemostat Population of Unicellular Algae	416
15.1	Introduction	416
15.2	Population and nutrient balance in the chemostat	417
15.3	Modelling the chemostat	418
15.4	Analysis of the basic model	419
15.5	Time-delay models	420
15.5.1	A. Experimental evidence for a delay	420
15.5.2	B. Discrete delay	421
15.5.3	C. Distributed delay	422
15.5.4	D. Experimental tests	423
15.6	Main conclusions	424
15.7	Sources and suggested further reading	425
16	Stochastic Extinction in a Two-Species System	426
16.1	Introduction	426
16.2	Formulation of the model	427
16.3	Analysis of the model	428
16.4	Testing the model	429
16.5	A more realistic model	430
16.6	Conclusions	431
16.7	Sources and suggested further reading	432
17	Chemostat Population of Unicellular Algae	433
17.1	Introduction	433
17.2	Population and nutrient balance in the chemostat	434
17.3	Modelling the chemostat	435
17.4	Analysis of the basic model	436
17.5	Time-delay models	437
17.5.1	A. Experimental evidence for a delay	437
17.5.2	B. Discrete delay	438
17.5.3	C. Distributed delay	439
17.5.4	D. Experimental tests	440
17.6	Main conclusions	441
17.7	Sources and suggested further reading	442
18	Stochastic Extinction in a Two-Species System	443
18.1	Introduction	443
18.2	Formulation of the model	444
18.3	Analysis of the model	445
18.4	Testing the model	446
18.5	A more realistic model	447
18.6	Conclusions	448
18.7	Sources and suggested further reading	449
19	Chemostat Population of Unicellular Algae	450
19.1	Introduction	450
19.2	Population and nutrient balance in the chemostat	451
19.3	Modelling the chemostat	452
19.4	Analysis of the basic model	453
19.5	Time-delay models	454
19.5.1	A. Experimental evidence for a delay	454
19.5.2	B. Discrete delay	455
19.5.3	C. Distributed delay	456
19.5.4	D. Experimental tests	457
19.6	Main conclusions	458
19.7	Sources and suggested further reading	459
20	Stochastic Extinction in a Two-Species System	460
20.1	Introduction	460
20.2	Formulation of the model	461
20.3	Analysis of the model	462
20.4	Testing the model	463
20.5	A more realistic model	464
20.6	Conclusions	465
20.7	Sources and suggested further reading	466
