Preface

vii

1. Why are tropical birds interesting?

- 1.1 Ecology and breeding seasons 1
- 1.2 Species diversity 4
- 1.3 Behavioral diversity in tropical birds 5

2. Timing of breeding

- 2.1 Seasonality in tropical breeding seasons 9
- 2.2 Food availability and timing of breeding 11
- 2.3 Nest predation and feather molt 16
- 2.4 Optimal timing of breeding and fitness 19

3. Life history traits

- 3.1 High adult and juvenile survival 21
- 3.2 High Nest predation 24
- 3.3 Small clutch size 26
- 3.4 Slow pace of life and physiology 34

4. Mating systems

- 4.1 Monogamy, sex role convergence, and mate choice 38
- 4.2 Extra-pair mating systems: Tropics versus temperate zone 39
- 4.3 Promiscuity 45
- 4.4 Cooperative breeding 51

5. Territoriality

- 5.1 Territory systems 56
- 5.2 Territory defense 59
- 5.3 Testosterone 62
- 5.4 Territory acquisition 66
- 5.5 Territory switching and divorce 67
- 5.6 Territory quality and individual fitness 70

6. Intratropical and altitudinal migration	
6.1 Intratropical migration	75
6.2 Altitudinal migration	84
7. Communication	
7.1 The assessment/management concept in communication	91
7.2 Song, territoriality and extra-pair behavior	94
7.3 Sex role convergence in song and duetting	100
7.4 Song ranging, neighborhood stability, and dialects	104
7.5 Plumage signals	111
8. Biotic interactions	
8.1 Birds and plants	117
8.2 Avoiding predators	126
8.3 Mixed-species flocks	129
8.4 Interspecific competition	133
8.5 What biotic interactions mean to the conservation of tropical birds	135
9. Behavior and conservation	
9.1 Tropical bird declines	137
9.2 Gap-crossing and dispersal in fragmented landscapes	139
9.3 Habitat fragmentation, nesting success, and source-sink dynamics	143
9.4 Intratropical and altitudinal migration	145
9.5 Climate change	148
10. Conclusion: Is the temperate zone bias still a problem?	
10.1 Previous knowledge gaps that are now better filled	155
10.2 New topics in behavioral ecology	161
10.3 Current knowledge gaps	161
