Preface to English edition	v
Foreword	vii
Introduction	1
The femtosecond laser pulse technique as a new stage in the studies of ultrafast processes and in the production of high-intensity fields 1	
Generation and shaping of optical pulses: from intensity modulation to fast phase control in active and passive nonlinear systems 3	
1. Short optical pulses in linear dispersive media	9
1.1. Linear propagation of short optical pulses; general as- pects 9	
Optics of wave packets; the historical background 9	
Methods of description 11	
The spatio-temporal analogy 14	
Models of optical pulses 15	
<i>A transform-limited pulse</i> 15	
<i>A phase-modulated (PM) pulse</i> 16	
<i>A super-Gaussian pulse</i> 16	
<i>Pulse containing noise</i> 17	
1.2. Propagation of a steep-front optical pulse; precursors 17	
1.3. Propagation of wave packets in a homogeneous disper- sive medium; dispersive spreading 20	
The second-order approximation of the dispersion the- ory; the analogy with beam diffraction 20	
The third- and higher-order approximations of the dis- persion theory 23	
1.4. Fourier optics of wave packets 26	
Propagation of phase-modulated Gaussian pulses; aber- rations 27	

Compression of PM optical pulses and focusing of optical beams	30
Compression of super-Gaussian optical pulses	34
Deformation of FM pulses of arbitrary shape; a spectron; pulse shape reversal	35
<i>A spectron; the pulse shape in the far-field zone</i>	36
<i>Pulse shape reversal</i>	37
Control of a pulse envelope by Fourier-optics methods	38
1.5. Transmission of ultrashort light pulses through optical devices	41
Filtering of FM optical pulses	41
Refraction of pulses at a boundary between dispersive media; transverse group delay	42
Total internal reflection of ultrashort pulses	44
Reflection of an ultrashort pulse from a mirror	46
Diffraction of a pulse by a grating	48
Transmission of ultrashort pulses through interferometers	51
1.6. Diffraction of ultrashort pulses	53
Spatial and temporal modulation effects	54
Focusing of ultrashort optical pulses	55
1.7. Optical wave packets in optical fibers	59
1.8. Some statistical problems; evolution of noise pulses in dispersive media	62
The duration and correlation time of noise pulses	62
The temporal analog of the van Cittert-Zernike theorem	64
Mutual influence of temporal and spatial fluctuations	65
Quantum fluctuations of pulses; duration of a statistically mean pulse; statistically mean parameters	65
<i>A statistically mean pulse</i>	68
<i>Photon statistics; quantum invariants</i>	69
<i>Statistically mean parameters of a quantum pulse</i>	70
1.9. Reflection of ultrashort optical pulses from a surface with random periodic profile	72
Diffraction of a monochromatic optical wave by a surface with periodic profile	72
Propagation of optical fields in vacuum; the Wood anomalies	74
Diffraction of an ultrashort optical pulse under conditions of the Wood anomalies	77
Absorption of ultrashort optical pulses by a periodically modulated surface	80

2. Self-action of optical pulses: self-modulation, self-compression, solitons, and instabilities	83
2.1. Physics of self-actions; a nonlinear refractive index; conversion of amplitude modulation to phase modulation	83
Quasi-steady-state response in a medium with cubic nonlinearity; a nonlinear index of refraction \tilde{n}_2	85
Dispersive self-action of wave packets; conversion of amplitude modulation to phase modulation	87
Temporal and spatial self-actions; similarities and differences	87
Dispersive self-actions and instabilities	89
2.2. Equations of transient nonlinear optics	89
Quasi-steady-state and transient self-actions	90
2.3. Self-phase modulation of regular pulses	93
A medium with fast nonlinearity	93
A medium with inertial nonlinearity	96
2.4. Self-steepening of optical pulses; shock waves of envelope	98
Envelope deformation	99
Spectral broadening	100
2.5. Self-focusing of ultrashort pulses	102
Steady-state self-focusing	102
Quasi-steady-state self-focusing	104
Transient self-focusing	106
2.6. Superbroadening of spectrum; spectral description of temporal self-actions	108
Models of spectral continuum generation	110
On spectral description of temporal self-actions	111
2.7. Steady-state pulses: soliton regime of propagation	113
The combined effect of nonlinearity and dispersion of a medium; Schrödinger solitons	113
Strong resonant self-actions; 2π pulses: resonant solitons	115
2.8. Instability of optical waves in nonlinear media; self-action of randomly modulated pulses	119
Temporal instability of continuous radiation	119
Spatial instability of plane waves and wave beams	122
Modulation instability of pulses	123
Self-action of random pulses	123
2.9. Quantum theory of self-action; formation of non-classical optical fields	127
Quantum nonlinear Schrödinger equation	127
Quantum light squeezing	129
Quantum instability of continuous radiation in a nonlinear medium	133

3. Parametric interactions and coherent scattering of femtosecond pulses	137
3.1. Physics of nonlinear interactions of ultrashort optical wave packets	137
3.2. Ultrashort pulse frequency doubling	139
The first-order approximation of the dispersion theory	139
<i>Group-velocity matching; quasi-steady-state regime</i>	140
<i>Group-delay effects; transient regime</i>	140
<i>Transient frequency doubling of a PM pulse</i>	143
<i>Back-action effects of SH on a phase of the primary radiation; the fixed intensity approximation</i>	143
<i>Frequency multiplication of PM pulses; numerical results</i>	146
<i>Strong energy conversion at large group-velocity mismatch; generation of "giant" SH pulses</i>	146
Dispersive spreading of pulses; the optimum pulse duration for frequency multiplication	148
Dispersive effects of nonlinear coupling	149
3.3. Parametric amplification of short pulses	150
Reshaping and compression of pulses by parametric interactions; the basic equations	150
<i>Quasi-steady-state and transient parametric amplification; pulse duration control</i>	151
<i>Group-velocity mismatch effects</i>	152
Control of the sign and velocity of frequency modulation	154
3.4. Sum-frequency generation; parametric solitons	156
Summation of frequencies of ultrashort pulses	156
Parametric solitons	157
3.5. Difference-frequency generation and IR Cherenkov radiation of femtosecond pulses	158
Difference-frequency generation as a method to obtain coherent IR radiation; phase matching conditions	158
Cherenkov radiation of a nonlinear polarization wave excited by a doublet of quasi-monochromatic waves	160
Cherenkov radiation of ultrashort optical pulses; optical detection	162
3.6. Stimulated Raman scattering of ultrashort pulses	165
Physics of scattering; the basic equations	165
Group delay effects in a medium with broad Raman lines	167
SRS under conditions of group-velocity matching; Raman solitons	170
The transient molecular response	173

3.7. Ultrashort optical pulses in coherent light scattering spectroscopy	176
Biharmonic pumping: from spectrochronography and measurement of envelopes of coherent and non-coherent signals to direct registration of optical oscillations	176
Steady-state spectroscopy; spectrochronography; transient spectroscopy	177
Application of CARS spectrochronography for diagnosis of state and fast laser-induced phase transitions at a semiconductor surface	180
Transient coherent spectroscopy; methods and results	183
Registration of molecular oscillation wave forms; an optical sampling oscilloscope	186
Nonselective excitation of molecular oscillations; spectrum reconstruction from a pulsed response	189
Femtosecond CARS spectroscopy of polaritons with temporal and spatial resolution	189
Transient polarization CARS spectroscopy of atoms	191
3.8. Ultrashort acoustic pulses; optical generation methods	191
Sub-nanosecond and picosecond pulses in physical and applied acoustics	191
Optical excitation and detection of acoustic pulses; experimental data review	194
Electronic mechanism of optical generation of sound in semiconductors; prospects for generation of extremely short acoustic pulses	197
4. Fast phase control; compression and shaping of optical pulses	203
4.1. Nonlinear optical phase modulators	203
4.2. Optical compressors	205
4.3. Dispersive self-phase modulation	208
4.4. Optimization of compression systems	210
4.5. Spectral filtering and compression of noise pulses	213
4.6. Control of duration and shape of ultrashort pulses	218
4.7. Special features of self-action and compression of high-power femtosecond pulses	221
4.8. Compression systems using parametric amplification	224
5. Optical solitons; picosecond and femtosecond pulses in optical information systems	227
5.1. Formation of optical solitons: competition and balance of nonlinear compression and dispersive spreading effects	227
5.2. Single-soliton and multisoliton solutions of the nonlinear Schrödinger equation	229

5.3.	Experimental demonstration of optical solitons	234
5.4.	Self-compression of high-power picosecond pulses	236
5.5.	Solitons in transmission lines; the role of perturbing factors	238
	Optical losses and their compensation by Raman gain	239
	Higher-order dispersion effects	241
	Dispersion of nonlinearity	241
	Interaction of solitons	244
5.6.	Soliton lasers	246
5.7.	Generation of picosecond pulse trains with high repetition rates; use of modulation instabilities	250
5.8.	Analysis of nonlinear wave fields by the inverse scattering method	253
5.9.	Nonlinear filtering of noise pulses; soliton statistics	258
	Amplitude fluctuation of an initial pulse	262
	Phase fluctuations	262
	Transient amplitude and phase noise	263
5.10.	Reconstruction of the picosecond laser pulse shape	267
	Positional method	267
	Method of variation of probing soliton velocity	271
5.11.	Quantum theory of optical solitons	272
6.	Femtosecond laser systems	277
6.1.	Basic principles of construction of femtosecond laser systems	277
6.2.	Solid-state master oscillators	280
	Picosecond solid-state lasers	280
	Continuously pumped solid-state lasers with active mode locking	282
	Q-switched solid-state lasers with active mode locking	283
6.3.	Frequency tunable picosecond and femtosecond lasers	284
	Femtosecond pulses in dye lasers with passive mode locking	285
	Synchronously pumped dye lasers	286
	A minimal pulse duration in synchronously pumped lasers	289
	Statistical characteristics of synchronously pumped lasers	290
	The hybrid active-passive mode locking	293
	Transient generation conditions	294
	Other types of synchronously pumped lasers	295
	Parametric generation of ultrashort pulses	296
	Parametric generation of pulses of squeezed light	297
6.4.	Compression systems: experimental data review	298
	Compression of picosecond dye laser pulses	299
	Compression of quasi-cw radiation of solid-state lasers	301

Nonlinear filtering and compression of pulses produced by <i>Q</i> -switched solid-state lasers with active mode locking	303
Experiments on production of extremely short pulses in the visible range	305
Cross-phase modulation technique applied for shaping extremely short pulses	307
6.5. Ultrashort pulse amplification	308
Dye amplifiers	308
Neodymium-glass amplifiers	311
6.6. Generation and amplification of high-power femtosecond pulses in the UV range	312
6.7. Femtosecond pulses in the far IR range	318
6.8. Advances in the femtosecond pulse measurement technique	321
Correlators for femtosecond pulses	322
Measurement of intensity and phase as a function of time	325
Spectral methods to study the stability of radiation parameters in quasi-cw lasers	328
Conclusion	333
Ultrashort optical pulses; is there a limit to pulse compression?	333
Superintense radiation: from terawatt to pentawatt powers	334
Interaction of optical radiation with matter; characteristic values on the intensity scale	336
Ultimate resources of nonresonant nonlinear optics of transparent media; tunable generators of superintense radiation	337
Femtosecond laser plasma as an active medium for picosecond x-ray sources and table-top x-ray lasers	339
Incoherent sources of ultrashort x-ray pulses	340
Femtosecond laser plasma as a lasing medium for x-ray lasers; towards to a table-top x-ray lasers	341
Nonlinear x-ray optics	342
High-power short pulses: state of the art	342
Bibliography	345
Index	363
