

QUANTUM PHYSICS OF MATTER

Introduction	6
Chapter 1 Quantum gases	7
1 What is a quantum gas?	7
2 Quantum theory of a gas of distinguishable molecules	9
2.1 Review of the classical statistical theory of an ideal gas	10
2.2 Quantization of translational energy and the density of states	14
2.3 Origins of the Boltzmann factor	17
3 Identical particles in quantum mechanics	21
3.1 Indistinguishability of identical particles	22
3.2 Counting configurations of indistinguishable particles	22
3.3 Replacing the Boltzmann factor	26
3.4 When does indistinguishability matter?	28
4 The photon gas — blackbody radiation explained	30
4.1 Energy distribution of a photon gas	31
4.2 Planck's radiation law	33
4.3 Consequences of Planck's radiation law	35
4.4 Other gases of bosons	38
5 The electron gas in metals	41
5.1 Drude's classical model of the free electrons in metals	41
5.2 Pauli's quantum model of an electron gas	44
5.3 Consequences of Pauli's distribution	48
5.4 Other gases of fermions	49
6 Closing items	50
Appendix to Chapter 1	55
Chapter 2 Solid-state physics	57
1 Beyond tin disease	57
2 The bonding and structure of solids	58
2.1 Bonding in molecules	58
2.2 Bonding in solids	61
2.3 Imperfections and mechanical strength	68
3 Free-electron models of conduction in solids	71
3.1 Survey of electrical and thermal conductivities	71
3.2 Free-electron models of electrical conduction	73
3.3 Free-electron models — successes and failures	78
4 Band theory of solids	80
4.1 Energy band formation in solids	80
4.2 Conductors, insulators and semiconductors	83
4.3 Types of semiconductors	88
5 The p–n junction and semiconductor devices	92
5.1 Semiconducting materials	92
5.2 The p–n junction in equilibrium	93
5.3 The p–n junction diode	95
5.4 Semiconductor devices	97

6 Superconductivity	102
6.1 Introducing superconductivity	102
6.2 The origin of superconductivity	104
6.3 Superconductors and their applications	106
6.4 High-temperature superconductivity	107
7 Closing items	109
Chapter 3 Nuclear physics	113
1 Energy puzzles	113
2 Characteristics of atomic nuclei	114
2.1 Nuclear composition	114
2.2 Nuclear sizes	116
2.3 Radioactive decay	119
2.4 The exponential decay law	123
2.5 A survey of known nuclei	125
2.6 Two applications of radioactivity	128
3 Nuclear stability and binding energies	129
3.1 Nuclear binding energies	130
3.2 Binding energy per nucleon	131
3.3 Fission and fusion	132
3.4 The valley of stability	134
4 Nuclear structure	136
4.1 The semi-empirical model of the nucleus	136
4.2 The nuclear shell model	140
4.3 Overview of the Z - N plane	145
5 Quantum-mechanical tunnelling in nuclear reactions	146
5.1 Tunnelling and α -decay	147
5.2 Tunnelling and the first nuclear accelerator	148
5.3 Tunnelling before there were stars	150
5.4 Tunnelling in the Sun and other stars	150
5.5 Nuclear fission — a case study	152
6 Closing items	155
Chapter 4 Particle physics	159
1 The challenge of particle physics	159
1.1 Leptons and quarks — a brief preview	160
2 Introduction to particle physics and its techniques	162
2.1 Early discoveries	162
2.2 High-energy collisions	163
2.3 Experimental techniques	165
3 Particles and their interactions	174
3.1 The fundamental forces	174
3.2 Families of particles	175
3.3 More hadrons — strangeness and resonances	177
3.4 More leptons — neutrinos and the tauon	181
4 The quark model for hadrons	183
4.1 The six quarks	183
4.2 Using the quark model	184
4.3 Evidence for the existence of quarks	186

5 Quantum physics of fundamental particles	188
5.1 Quantum field theories — a brief overview	189
5.2 The standard model and beyond	192
5.3 Optional multimedia activity	194
6 Closing items	194
Chapter 5 Consolidation and skills development	197
1 Introduction	197
2 Overview of Chapters 1 to 4	197
2.1 Quantum gases	198
2.2 Solid-state physics	202
2.3 Nuclear physics	203
2.4 Particle physics	204
3 Preparing for and taking exams	206
3.1 Before the exam	206
3.2 In the exam room	208
4 Revision questions	208
5 Interactive questions	211
6 Postscript	211
Answers and comments	213
Acknowledgements	230
Index	231
