

Contents

1 Introduction	1
1.1 Neutron optics and the analogy with light optics	1
1.2 The quantum phase shift of matter waves	9
1.3 Basic neutron diffraction phenomena	18
2 Neutron interferometers and apparatus	23
2.1 The perfect silicon crystal interferometer	23
2.2 Interferometer setups	32
2.3 Interferometers based upon cold and ultra-cold neutrons	37
2.4 Larmor interferometry	45
3 Neutron interactions and coherent scattering lengths	54
3.1 Nuclear interaction	54
3.2 Electromagnetic interactions	74
3.3 Parity-violating interactions	85
3.4 External influences	86
4 Coherence properties	93
4.1 Basic relations	95
4.2 Coherence measurements	99
4.3 Partial beam path detection	113
4.4 Counting statistics	125
4.5 Post-selection experiments	137
5 Spinor symmetry and spin superposition	165
5.1 Spinor symmetry	165
5.2 Spin superposition	169
5.3 Time-dependent spinor superposition	173
5.4 Double coil experiments and the magnetic Josephson effect	176
5.5 Multi-photon exchange experiments	184
6 Topological and geometric phases	189
6.1 Aharonov–Casher effect (vector Aharonov–Bohm effect)	189
6.2 Scalar Aharonov–Bohm effect	194
6.3 Topological phases	200

7	Gravitational, non-inertial, and motional effects	211
7.1	Gravitationally induced quantum interference	211
7.2	Sagnac effect	229
7.3	Acceleration-induced interference	236
7.4	Connections with photons	237
7.5	Neutron Fizeau effects	238
8	Forthcoming and more speculative experiments	256
8.1	Non-linearity of the Schrödinger equation	256
8.2	Aharonov–Bohm analogue	257
8.3	Quaternions in quantum mechanics	258
8.4	Non-ergodic effects	259
8.5	Wheeler delayed-choice experiments	260
8.6	Neutron–antineutron oscillations	261
8.7	Non-Newtonian gravity effects	262
8.8	Spin–rotation coupling	262
8.9	Hanbury Brown–Twiss analogue	263
8.10	The search for nuclear quantum entanglement	265
8.11	Confinement and gravity quantized phases	265
8.12	The Anandan acceleration	268
8.13	Search for basic dissipative terms	274
8.14	Bell type non-locality experiments	275
9	Solid state physics applications	278
9.1	Contrast reduction due to inhomogeneities	278
9.2	Phase contrast topography and tomography	283
9.3	Neutron Fourier spectroscopy	287
10	Perfect-crystal neutron optics	294
10.1	The transition from kinematic to dynamical diffraction	294
10.2	Dynamical diffraction for the symmetric Laue case	295
10.3	Anomalous transmission, angle amplification, and high collimation effects	304
10.4	Pendellösung interference effects	312
10.5	Primary extinction and the width of a Bragg reflection	316
10.6	The Takagi–Taupin equations	317
10.7	Theory of the perfect crystal neutron interferometer	324
11	Interpretational questions	350
