Foreword	ix
Foreword to the First Edition	xi
Preface	xiii
<b>1 Foundation</b>	<b>1</b>
Problem: Building a Network	1
1.1 Applications	2
1.1.1 Classes of Applications	3
1.2 Requirements	6
1.2.1 Stakeholders	7
1.2.2 Scalable Connectivity	8
1.2.3 Cost-Effective Resource Sharing	13
1.2.4 Support for Common Services	17
1.2.5 Manageability	22
1.3 Architecture	23
1.3.1 Layering and Protocols	24
1.3.2 Encapsulation	28
1.3.3 Multiplexing and Demultiplexing	30
1.3.4 Seven-Layer OSI Model	31
1.3.5 Internet Architecture	33
1.4 Software	36
1.4.1 Application Programming Interface (Sockets)	37
1.4.2 Example Application	40
1.5 Performance	43
1.5.1 Bandwidth and Latency	44
1.5.2 Delay $\times$ Bandwidth Product	49
1.5.3 High-Speed Networks	50
1.5.4 Application Performance Needs	52
Perspective: Feature Velocity	55

Broader Perspective	56
Exercises	57
<b>2 Direct Links</b>	<b>67</b>
Problem: Connecting to a Network	67
2.1 Technology Landscape	68
2.2 Encoding	74
2.3 Framing	78
2.3.1 Byte-Oriented Protocols (PPP)	79
2.3.2 Bit-Oriented Protocols (HDLC)	81
2.3.3 Clock-Based Framing (SONET)	83
2.4 Error Detection	87
2.4.1 Internet Checksum Algorithm	89
2.4.2 Cyclic Redundancy Check	91
2.5 Reliable Transmission	97
2.5.1 Stop-and-Wait	98
2.5.2 Sliding Window	100
2.5.3 Concurrent Logical Channels	112
2.6 Multiaccess Networks	113
2.6.1 Physical Properties	114
2.6.2 Access Protocol	115
2.6.3 Longevity of Ethernet	120
2.7 Wireless Networks	121
2.7.1 Basic Issues	123
2.7.2 802.11/Wi-Fi	127
2.7.3 Bluetooth (802.15.1)	135
2.8 Access Networks	137
2.8.1 Passive Optical Network	138
2.8.2 Cellular Network	139
Perspective: Race to the Edge	145
Broader Perspective	147
Exercises	147

<b>3 Internetworking</b>	163
Problem: Not All Networks Are Directly Connected	163
3.1 Switching Basics	164
3.1.1 Datagrams	166
3.1.2 Virtual Circuit Switching	168
3.1.3 Source Routing	179
3.2 Switched Ethernet	182
3.2.1 Learning Bridges	183
3.2.2 Implementation	184
3.2.3 Spanning Tree Algorithm	186
3.2.4 Broadcast and Multicast	192
3.2.5 Virtual LANs (VLANs)	193
3.3 Internet (IP)	195
3.3.1 What Is an Internetwork?	195
3.3.2 Service Model	198
3.3.3 Global Addresses	206
3.3.4 Datagram Forwarding in IP	208
3.3.5 Subnetting and Classless Addressing	211
3.3.6 Address Translation (ARP)	219
3.3.7 Host Configuration (DHCP)	222
3.3.8 Error Reporting (ICMP)	226
3.3.9 Virtual Networks and Tunnels	226
3.4 Routing	230
3.4.1 Network as a Graph	232
3.4.2 Distance-Vector (RIP)	234
3.4.3 Link State (OSPF)	242
3.4.4 Metrics	252
3.5 Implementation	256
3.5.1 Software Switch	256
3.5.2 Hardware Switch	258
3.5.3 Software-Defined Networks	262
Perspective: Virtual Networks All the Way Down	265
Broader Perspective	267
Exercises	267

<b>4</b>	<b>Advanced Internetworking</b>	291
	Problem: Scaling to Billions	291
4.1	Global Internet	292
4.1.1	Routing Areas	294
4.1.2	Interdomain Routing (BGP)	297
4.2	IP Version 6	308
4.2.1	Historical Perspective	309
4.2.2	Addresses and Routing	310
4.2.3	Packet Format	315
4.2.4	Advanced Capabilities	317
4.3	Multicast	319
4.3.1	Multicast Addresses	321
4.3.2	Multicast Routing (DVMRP, PIM, MSDP)	322
4.4	Multiprotocol Label Switching	334
4.4.1	Destination-Based Forwarding	336
4.4.2	Explicit Routing	342
4.4.3	Virtual Private Networks and Tunnels	344
4.5	Routing Among Mobile Devices	348
4.5.1	Challenges for Mobile Networking	349
4.5.2	Routing to Mobile Hosts (Mobile IP)	352
	Perspective: The Cloud Is Eating the Internet	359
	Broader Perspective	360
	Exercises	361
<b>5</b>	<b>End-to-End Protocols</b>	369
	Problem: Getting Processes to Communicate	369
5.1	Simple Demultiplexor (UDP)	371
5.2	Reliable Byte Stream (TCP)	374
5.2.1	End-to-End Issues	374
5.2.2	Segment Format	377
5.2.3	Connection Establishment and Termination	380
5.2.4	Sliding Window Revisited	385
5.2.5	Triggering Transmission	392

5.2.6	Adaptive Retransmission	395
5.2.7	Record Boundaries	399
5.2.8	TCP Extensions	400
5.2.9	Performance	403
5.2.10	Alternative Design Choices (SCTP, QUIC)	405
5.3	Remote Procedure Call	410
5.3.1	RPC Fundamentals	411
5.3.2	RPC Implementations (SunRPC, DCE, gRPC)	419
5.4	Transport for Real-Time (RTP)	432
5.4.1	Requirements	434
5.4.2	RTP Design	437
5.4.3	Control Protocol	441
	Perspective: HTTP Is the New Narrow Waist	445
	Broader Perspective	447
	Exercises	447
<b>6</b>	<b>Congestion Control</b>	461
	Problem: Allocating Resources	461
6.1	Issues in Resource Allocation	462
6.1.1	Network Model	463
6.1.2	Taxonomy	467
6.1.3	Evaluation Criteria	470
6.2	Queuing Disciplines	473
6.2.1	FIFO	474
6.2.2	Fair Queuing	476
6.3	TCP Congestion Control	481
6.3.1	Additive Increase/Multiplicative Decrease	482
6.3.2	Slow Start	485
6.3.3	Fast Retransmit and Fast Recovery	490
6.3.4	TCP CUBIC	494
6.4	Advanced Congestion Control	495
6.4.1	Active Queue Management (DECbit, RED, ECN)	495

6.4.2	Source-Based Approaches (Vegas, BBR, DCTCP)	504
6.5	Quality of Service	512
6.5.1	Application Requirements	513
6.5.2	Integrated Services (RSVP)	519
6.5.3	Differentiated Services (EF, AF)	530
6.5.4	Equation-Based Congestion Control	536
	Perspective: Software-Defined Traffic Engineering	539
	Broader Perspective	540
	Exercises	541
<b>7</b>	<b>End-to-End Data</b>	555
	Problem: What Do We Do With the Data?	555
7.1	Presentation Formatting	557
7.1.1	Taxonomy	558
7.1.2	Examples (XDR, ASN.1, NDR, Protobufs)	562
7.1.3	Markup Languages (XML)	569
7.2	Multimedia Data	573
7.2.1	Lossless Compression Techniques	575
7.2.2	Image Representation and Compression (GIF, JPEG)	577
7.2.3	Video Compression (MPEG)	585
7.2.4	Transmitting MPEG Over a Network	590
7.2.5	Audio Compression (MP3)	595
	Perspective: Big Data and Analytics	597
	Broader Perspective	599
	Exercises	599
<b>8</b>	<b>Network Security</b>	607
	Problem: Security Attacks	607
8.1	Trust and Threats	608
8.2	Cryptographic Building Blocks	610
8.2.1	Principles of Ciphers	610
8.2.2	Secret-Key Ciphers	613

8.2.3	Public-Key Ciphers	615
8.2.4	Authenticators	618
8.3	Key Predistribution	622
8.3.1	Predistribution of Public Keys	622
8.3.2	Predistribution of Secret Keys	627
8.3.3	Diffie–Hellman Key Exchange	628
8.4	Authentication Protocols	631
8.4.1	Originality and Timeliness Techniques	632
8.4.2	Public-Key Authentication Protocols	633
8.4.3	Secret-Key Authentication Protocols	635
8.5	Example Systems	639
8.5.1	Pretty Good Privacy (PGP)	640
8.5.2	Secure Shell (SSH)	642
8.5.3	Transport Layer Security (TLS, SSL, HTTPS)	645
8.5.4	IP Security (IPsec)	650
8.5.5	Wireless Security (802.11i)	653
8.5.6	Firewalls	656
	Perspective: Blockchain and a Decentralized Internet	661
	Broader Perspective	663
	Exercises	663
<b>9</b>	<b>Applications</b>	<b>671</b>
	Problem: Applications Need Their Own Protocols	671
9.1	Traditional Applications	672
9.1.1	Electronic Mail (SMTP, MIME, IMAP)	674
9.1.2	World Wide Web (HTTP)	682
9.1.3	Web Services	691
9.2	Multimedia Applications	701
9.2.1	Session Control and Call Control (SDP, SIP, H.323)	702
9.2.2	Resource Allocation for Multimedia Applications	712
9.3	Infrastructure Applications	718
9.3.1	Name Service (DNS)	718

9.3.2	Network Management (SNMP, OpenConfig)	729
9.4	Overlay Networks	734
9.4.1	Routing Overlays	736
9.4.2	Peer-to-Peer Networks	744
9.4.3	Content Distribution Networks	758
	Perspective: The Cloud Is the New Internet	765
	Broader Perspective	766
	Exercises	766
<b>Solutions to Select Exercises</b>		773
<b>Glossary</b>		785
<b>Index</b>		805
7.1	1.1.1	557
7.1	1.1.2	558
7.1	1.1.3	562
7.1	1.1.4	569
7.2	2.1	575
7.2	2.2	575
7.2	2.3	577
7.2	2.4	585
7.2	2.5	590
7.2	2.6	595
7.2	2.7	597
7.2	2.8	599
7.2	2.9	599
7.2	2.10	607
7.2	2.11	607
7.2	2.12	608
7.2	2.13	610
7.2	2.14	610
7.2	2.15	613
