Preface .....	xii
To the Student .....	xiii
<b>1. Differential Equations and Models .....</b>	<b>1</b>
1.1 Differential Equations .....	2
1.1.1 Equations and Solutions .....	2
1.1.2 Geometrical Interpretation .....	9
1.2 Pure Time Equations .....	13
1.3 Mathematical Models .....	19
1.3.1 Particle Dynamics .....	21
1.3.2 Autonomous Differential Equations .....	28
1.3.3 Stability and Bifurcation .....	41
1.3.4 Heat Transfer .....	45
1.3.5 Chemical Reactors .....	48
1.3.6 Electric Circuits .....	51
<b>2. Analytic Solutions and Approximations .....</b>	<b>55</b>
2.1 Separation of Variables .....	55
2.2 First-Order Linear Equations .....	61
2.3 Approximation .....	70
2.3.1 Picard Iteration .....	71
2.3.2 Numerical Methods .....	74
2.3.3 Error Analysis .....	78
Appendix A. References .....	295
Appendix B. Computer Algebra Systems .....	303
B.1 MATLAB .....	303
B.2 Maple .....	306
B.3 Mathematica .....	309
B.4 Octave .....	312
Appendix C. Sample Experiments .....	313
Appendix D. Solutions and Theory to Selected Problems .....	371
Index .....	397

<b>3. Second-Order Differential Equations .....</b>	83
3.1 Particle Mechanics .....	84
3.2 Linear Equations with Constant Coefficients .....	87
3.3 The Nonhomogeneous Equation .....	95
3.3.1 Undetermined Coefficients .....	96
3.3.2 Resonance .....	102
3.4 Variable Coefficients .....	105
3.4.1 Cauchy–Euler Equation .....	106
3.4.2 Power Series Solutions .....	109
3.4.3 Reduction of Order .....	111
3.4.4 Variation of Parameters .....	112
3.5 Boundary Value Problems and Heat Flow .....	117
3.6 Higher-Order Equations .....	124
3.7 Summary and Review .....	127
 <b>4. Laplace Transforms .....</b>	133
4.1 Definition and Basic Properties .....	133
4.2 Initial Value Problems .....	140
4.3 The Convolution Property .....	145
4.4 Discontinuous Sources .....	149
4.5 Point Sources .....	152
4.6 Table of Laplace Transforms .....	157
 <b>5. Linear Systems .....</b>	159
5.1 Introduction .....	159
5.2 Matrices .....	165
5.3 Two-Dimensional Systems .....	179
5.3.1 Solutions and Linear Orbits .....	179
5.3.2 The Eigenvalue Problem .....	185
5.3.3 Real Unequal Eigenvalues .....	187
5.3.4 Complex Eigenvalues .....	189
5.3.5 Real, Repeated Eigenvalues .....	191
5.3.6 Stability .....	194
5.4 Nonhomogeneous Systems .....	198
5.5 Three-Dimensional Systems .....	204
 <b>6. Nonlinear Systems .....</b>	209
6.1 Nonlinear Models .....	209
6.1.1 Phase Plane Phenomena .....	209
6.1.2 The Lotka–Volterra Model .....	217
6.1.3 Holling Functional Responses .....	221
6.1.4 An Epidemic Model .....	223

---

6.2 Numerical Methods . . . . .	229
6.3 Linearization and Stability . . . . .	233
6.4 Periodic Solutions . . . . .	246
6.4.1 The Poincaré–Bendixson Theorem . . . . .	249
<b>Appendix A. References . . . . .</b>	<b>255</b>
<b>Appendix B. Computer Algebra Systems . . . . .</b>	<b>257</b>
B.1 Maple . . . . .	258
B.2 MATLAB . . . . .	260
<b>Appendix C. Sample Examinations . . . . .</b>	<b>265</b>
<b>Appendix D. Solutions and Hints to Selected Exercises . . . . .</b>	<b>271</b>
<b>Index . . . . .</b>	<b>287</b>

There are many excellent texts on elementary differential equations designed for the standard sophomore course. However, in spite of the fact that most courses are one semester in length, the texts have evolved into calculus-like presentations that include a large collection of methods and applications, packaged with student manuals, and Web-based notes, projects, and supplements. All of this comes in several hundred pages of text with busy footnotes. Most students do not have the time or desire to read voluminous texts and explore internet supplements. The format of this differential equations book is different. It is a one-semester, brief treatment of the basic ideas, models, and solution methods. Its limited coverage places it somewhere between an online and a detailed textbook. I have tried to write compactly, to the point, and in plain language. Many worked examples and exercises are included. A student who works through this primer will have the tools to go to the next level in applying differential equations to problems in engineering, science, and applied mathematics. It can give some instructors, who want more concise coverage, an alternative to existing texts.

The numerical solution of differential equations is a central activity in science and engineering, and it is absolutely necessary to teach students some aspects of scientific computation as early as possible. I tried to build in flexibility regarding a computer environment. The text allows students to use a calculator or a computer algebra system to solve some problems numerically and symbolically, and templates of MATLAB and Maple programs and commands are given in an appendix. The instructor can include as much of this, or as little of this, as he or she desires.

For many years I have taught this material to students who have had a standard three-semester calculus sequence. It was well received by those who
