

CONTENTS

Executive Summary	iv
1. Introduction	1
1.1 Why both sex and gender are important for emerging infectious diseases.....	2
1.2 Why life-cycle differences in sex and gender need to be considered	3
1.3 Outline of this document	3
2. Description of the framework.....	7
2.1 The transmission model	7
2.2 Gender analysis matrix for emerging infectious disease.....	9
3. How sex and gender affect infectious disease transmission and outcomes and interact with health interventions	13
3.1 How sex and gender differences affect vulnerability to infectious disease (row 1 of gender analysis matrix).....	14
3.2 How sex and gender differences are related to exposure to pathogens (row 2 exposure)	16
3.3 How sex and gender affect response to illness (row 3 response to illness).....	19
3.4 How sex and gender affect the effectiveness of health interventions (row 4 public health interventions).....	21
4. Gender and the risk of acquiring infection in health care settings and encounters	25
4.1 Gender and health care workers in the health care setting.....	25
4.2 Pregnant women and infection control.....	29
5. Gender and diseases acquired from animals	33
5.1 Gender and farm animals	33
5.2 Gender and poultry	34
5.3 Gender and avian influenza	35
6. Gender and Surveillance.....	41
6.1 Need for disaggregation of epidemiological and clinical data by sex	41
6.2 Need for surveillance data on pregnancy status, especially for new diseases	42
6.3 Gender biases in surveillance data.....	42
6.4 Issues in analysis of sex and gender differences.....	44
7. Conclusions.....	49
8. References	51
APPENDIX A: Use of Framework for Avian Influenza	61
APPENDIX B: Questions for gender analysis for an emerging infectious disease ...	63
APPENDIX C: Modified gender analysis matrix from WPRO workshop on mainstreaming gender into health securities and emergencies	80
