UNIVERZITA PALACKÉHO V OLOMOUČI

Knihovna Přírodovědecké fakulty

PTK. č. 3134012104

Sign. M11/1011

Katedra PPF

Acknowledgements	10
Preface by Jacques Pitrat	11

PART ONE: INTRODUCTION 15

1 Aims and Basic Concepts of Artificial Intelligence	16
Symbolic representation	18
Heuristics	18
Knowledge representation	19
Incomplete data	20
Conflicting data	20
Ability to learn	21
Mimic human behavior at all costs?	22
Topics treated in this book	24
Notes and references	24

PART TWO: UNDERSTANDING NATURAL LANGUAGES 25

2 Some Criteria	26
Introduction	26
Some criteria for "understanding"	28
Notes and references	30
3 The Era of Natural Language Processing	31
Introduction	31
First attempts at automatic translation	31
The pre-semantic period	32
Notes and references	34
4 Understanding Isolated Phrases	35
The "semantic-syntactic" period	35
Theory of conceptual dependency	39
Notes and references	42

- 5 Some Techniques for the Analysis of Natural Languages 44**
 Recursive Transition Networks (RTNs) 44
 Augmented Transition Networks (ATNs) 46
 Analysis of queries 48
 The problem of pronominal references 50
 The problem of conjunctions and elliptic constructions 51
 Conclusion 52
 Notes and references 52
- 6 Understanding Speech: Some Aspects of the Problem 53**
 Levels of recognition 54
 Some speech-recognition programs 55
 Project HEARSAY 56
 Project MYRTILLE 56
 Control strategies 57
 Conclusion 58
 Notes and references 58
- 7 Friendly Interfaces in Natural Language 60**
 Introduction 60
 Interfaces at different levels 61
 An interface-building tool: LIFER 62
 Some immediate possibilities 65
 Notes and references 65
- 8 Understanding Text 67**
 Introduction 67
 Story grammars 68
 Scripts 68
 The SAM program 69
 The BAOBAB program 70
 "Plans" 72
 Limitations of scripts 74
 "MOPs" 74
 The revival of automatic translation 75
 Notes and references 78

PART THREE: REPRESENTATION OF KNOWLEDGE AND OF REASONING PROCESSES 81

Introduction 82

- 9 First-order Logic 85**
 The propositional calculus 85
 The predicate calculus 86
 Quantifiers 87

- Rules of inference 88
- Application to solving a problem: stacking blocks 88
- Notes and references 91

- 10 Procedural Representation 92**
 - Introduction 92
 - Advantages of declarative forms 93
 - Advantages of procedural forms 93
 - General assessment of procedural systems 94
 - Notes and references 95

- 11 Semantic Networks 96**
 - Introduction 96
 - Evolution of the network representation 97
 - Taxonomies 101
 - Partitioning semantic networks 103
 - Conclusion 106
 - Notes and references 106

- 12 Production Rules 108**
 - Introduction 108
 - The rule base 110
 - Classification of interpreters 111
 - Forward or backward chaining?* 111
 - Closed engine or guided dialog?* 112
 - Strategies for conflict resolution* 112
 - Does or does not allow quantified variables?* 113
 - Ability to combine items of uncertain information* 114
 - A simple (but specific) example 114
 - Use of plausibility measures in uncertain reasoning 116
 - Notes and references 119

- 13 Structured Objects 120**
 - Introduction 120
 - Characteristics of structured objects 121
 - Some examples 122
 - Handling objects 125
 - Reasoning from incomplete information, and by default 126
 - Notes and references 127

- 14 Programs for Playing Chess and Solving Problems 128**
 - Chess-playing programs 128
 - Problem solving 134
 - 1. *Geometrical analogies* 134
 - 2. *"Missionaries and cannibals" problem* 135
 - 3. *The GPS program* 137

- 4. *The ALICE program* 138
- Conclusion 139
- Notes and references 140

PART FOUR: EXPERT SYSTEMS 141

15 Characteristics of Expert Systems 142

- Introduction 142
- Principles of expert systems 143
- A short guide to the construction of expert systems 147
- Expert systems and transfer of expertise 150
- Metaknowledge 152
- Tools and formalisms for expert systems 153
- Limitations of present expert systems 154
- Notes and references 155

16 Expert Systems in Medicine and Biology 158

- Introduction 158
- Mathematical methods 159
- Methods that are intermediate between mathematics and AI 160
- Expert systems 161
 - MYCIN* 162
 - PIP (Present Illness Program)* 163
 - Internist/Caduceus* 164
 - VM (Ventilator Manager)* 165
 - Casnet/Expert (Causal ASSociation NETwork)* 166
- The state of the art 167
- Notes and references 168

17 Expert Systems in Science and Industry 170

- DENDRAL and META-DENDRAL* 170
- MACSYMA* 171
- PROSPECTOR* 172
- LITHO* 174
 - Stages in LITHO's reasoning* 174
 - Data from different sources* 177
 - Determination of the broad lithological structure* 177
 - External data* 177
 - Use of the general features of the wireline logs* 179
 - Final output from the program* 180
 - LITHO's handling of erroneous data* 182
 - Relevance of the field of application* 182
- Existing systems – summing up 184
- Notes and references 184

PART FIVE: PERSPECTIVES FOR THE FUTURE 187**18 Artificial Intelligence and Computer-Assisted Instruction 188**

Introduction 188

A little history 189

Components of an intelligent CAI system 190

The role of the expert system 191

The role of the teaching system 192

Architectural constraints on expert systems for CAI 194

Conclusion 194

Notes and references 195

19 Programs that can Learn 196

Introduction 196

General models for learning systems 198

General rules for induction 200

Winston program 202

Learning abstract structures 203

The AQ11 program 204

The AM program 206

Objects in AM 206

The BACON-3 program 207

Conclusion 209

Notes and references 209

20 Promise and Performance 211

Notes and references 214

Glossary 215

Abbreviations 217

Index 219
