CONTENTS

1. INTRODUCTION 7

2. SYSTEM REPRESENTATION 12

2.1 Introduction to Signal and System Models 12

2.2 Identification of Linear Time Invariant (LTI) Systems 17

2.2.1 ARMA model definition 17
2.2.2 Model parameter estimation 20
2.2.3 Model structure estimation 22
2.2.4 Exponential forgetting estimation 23
2.2.5 Algorithm of Kalman Filter 25

2.3 Identification of Non-linear Systems 26

2.3.1 Algorithm of Extended Kalman Filter 27
2.3.2 Genetic algorithm 30
2.3.3 Fuzzy algorithm 32

2.4 Identification of System's Performance Parameters 35

2.4.1 Definition of performance parameters 35
2.4.2 Quality of measured performance parameters 37
2.4.3 Estimation of performance parameters 38
2.4.4 Illustrative examples - simulations results 44

2.5 Multi-models Fusion 46

2.6 Multi-models Comparison 49

2.7 Conclusion 53

3. SYSTEM REPRESENTATION BY REDUCED DIMENSIONALITY MODEL 55

3.1 Statistical Dimensionality Reduction of Data Vectors 56

3.1.1 Classification problem definition 56
3.1.2 Reduced dimensionality model based on truncated SVD 58
3.1.3 Illustrative example - traffic operator's imitation 61

3.2 Dimensionality Reduction in Frequency Domain 67

3.2.1 Frequency reduction theorem 67
3.2.2 The algorithm of time series compression 69
3.2.3 Illustrative examples - time series compression 72

3.3 Dimensionality Reduction by Polynomial Approximation 81

3.3.1 Data modeling by splines 82
3.3.2 Illustrative example - GPS signal modeling 84

3.4 Conclusion 92

4. SYSTEM REPRESENTATION BY SET OF IDENTIFIED LOW DIMENSIONAL MODELS 94

4.1 System Decomposition Theory to Low Dimensional Models 95

4.1.1 Sylvester's theorems 95
4.1.2 Approximation of derivatives 97
4.1.3 Transformed eigenvalues method 99
4.1.4 Modified eigenvalues method 101

4.2 The LTI System Decomposition 101
4.2.1 The LTI system decomposition with distinct eigenvalues 102
4.2.2 The LTI system decomposition with repeated eigenvalues 103
4.2.3 Illustrative examples - LTI system decomposition 103
4.3 Identification Methods of Low Dimensional Models 112
4.3.1 Identification algorithm of low dimensional models 112
4.3.2 Illustratice examples - LTI low dimensional models identification 115
4.3.3 Approximation of non-linear system by low dimensional models 118
4.4 Conclusion 119
5. SYSTEM REPRESENTATION BY SET OF UNIVERSAL MODELS 121
5.1 Mathematical Theory of Complex Multi-Models 121
5.1.1 Multi-models composition theorem 123
5.1.2 Trigonometric spectral representation of complex multi-models 130
5.1.3 Illustrative example - binary time series modeling 131
5.1.4 Hyperbolic spectral representation of complex multi-models 134
5.2 Approximate Identification of Complex Multi-models 135
5.2.1 Theorem of multi-models identification 135
5.2.2 Illustrative example - LTI system modeling 138
5.2.3 Non-linear system modeling by complex multi-models 142
5.3 Understanding of Complex Multi-models 143
5.3.1 Interpretation of complex multi-models 144
5.3.2 Complex multi-models quantization 149
5.3.3 Illustrative examples - quantization of linear phase functions 152
5.4 Conclusion 153
