Contents

Preface xi

Notation and Convention xix

1 Hamiltonian systems and applications 1

1.1 Motion of massive particle 1

1.2 Many-body problem 6

1.3 Kepler's laws of planetary motion 8

1.4 Helmholtz–Kirchhoff vortex model 14

1.5 Partition function and thermodynamics 19

1.6 Dynamic modeling of DNA denaturation 22

2 Schrödinger equation and quantum mechanics 29

2.1 Path to quantum mechanics 29

2.2 Schrödinger equation 32

2.3 Quantum many-body problem 41

2.4 Hartree–Fock method 43

2.5 Thomas–Fermi approach 46

2.6 Density functional theory 49

3 Maxwell equations, Dirac monopole, and gauge fields 59

3.1 Maxwell equations and electromagnetic duality 59

3.2 Dirac monopole and strings 64

3.3 Charged particle in electromagnetic field 66

3.4 Removal of Dirac strings and charge quantization 69

3.5 Schwinger dyons and extended charge quantization formula 71

3.6 Aharonov–Bohm effect 73

4 Special relativity 79

4.1 Inertial frames, Minkowski spacetime, and Lorentz boosts 79

4.2 Line element, proper time, and consequences 82

4.3 Relativistic mechanics 86

4.4 Doppler effects 92

5 Abelian gauge field equations 96

5.1 Spacetime, covariance, and invariance 96

5.2 Relativistic field equations 102

5.3 Coupled nonlinear hyperbolic and elliptic equations 109

5.4 Symmetry breaking 111

5.5 Higgs mechanism 114

6 Dirac equations 119

6.1 Pauli matrices, spinor fields, and Dirac equation 119

6.2 Action, probability, and current densities 122

6.3 Special solutions 122

6.4 Dirac equation coupled with gauge field 125

6.5 Dirac equation in Weyl representation 129

6.6 Nonlinear Dirac equations 130

7 Ginzburg–Landau equations for superconductivity 133

7.1 Perfect conductors, superconductors, and London equations 133

7.2 Superconductors and Ginzburg–Landau equations 138

7.3 Classification of superconductivity by surface energy 143

7.4 Mixed state and its magnetic characterizations 149

7.5 Some generalized Ginzburg–Landau equations 152

8 Magnetic vortices in Abelian Higgs theory 157

8.1 Energy partition, flux quantization, and topological properties 157

8.2 Vortex-lines, solitons, and particles 162

8.3 Radially symmetric solutions 168

8.4 From monopole confinement to quark confinement 169

9 Non-Abelian gauge field equations 176
9.1 Yang–Mills theory 176
9.2 Georgi–Glashow model 181
9.3 't Hooft–Polyakov monopole and Julia–Zee dyon 186
9.4 Monopoles and dyons in BPS limit 190
9.5 Weinberg–Salam electroweak equations 199

10 Einstein equations and related topics 207
10.1 Einstein field equations 207
10.2 Cosmological consequences 215
10.3 Schwarzschild black-hole solution 228
10.4 Reissner–Nordström solution 238
10.5 Kerr solution 245
10.6 Gravitational mass and Penrose bounds 247
10.7 Gravitational waves 253
10.8 Scalar-wave matters as quintessence 255

11 Charged vortices and Chern–Simons equations 267
11.1 Julia–Zee theorem 267
11.2 Chern–Simons term 270
11.3 Dually charged vortices 271
11.4 Rubakov–Tavkhelidze problem 274

12 Skyrme model and related topics 281
12.1 Derrick theorem and Pohozaev identity 281
12.2 Skyrme model 286
12.3 Knots in Faddeev model 292
12.4 Other fractional-exponent growth laws and knot energies 297
12.5 Q-balls 302

13 Strings and branes 308
13.1 Motivation and relativistic motion of free particle as initial setup 308
13.2 Nambu–Goto strings 310
13.3 p-branes 314
13.4 Polyakov strings and branes 317
13.5 Equations of motion with interactions 321

14 Born–Infeld theory of electromagnetism 323
14.1 Resolution of energy divergence problem of point charges 323
14.2 Some illustrative calculations 329
14.3 Dyonic point charge 334
14.4 Formalism based on invariance 336
14.5 Generalized Bernstein problem 342
14.6 Born–Infeld term and virial identities 346
14.7 Integer-squared law for global Born–Infeld vortices 348
14.8 Electrically charged black hole solutions 353
14.9 Dyonic black hole solutions 360
14.10 Generalized Born–Infeld theories and applications 369
14.11 Electromagnetic asymmetry by virtue of point charges 371
14.12 Charged black holes 380
14.13 Relegation of curvature singularities of charged black holes 387
14.14 Cosmology driven by scalar-wave matters as k-essence 395
14.15 Finite-energy dyonic point charge 405
14.16 Dyonically charged black holes with relegated singularities 415

15 Canonical quantization of fields 429
15.1 Quantum harmonic oscillator 429
15.2 Canonical quantization 434
15.3 Field equation formalism 439
15.4 Quantization of Klein–Gordon equation 442
15.5 Quantization of Schrödinger equation 448
15.6 Quantization of electromagnetic fields 455
15.7 Thermodynamics of harmonic oscillator 463

Appendices 470
A.1 Index of vector field and topological degree of map 470
A.2 Linking number and Hopf invariant 484
A.3 Noether theorem 489
A.4 Spectra of angular momentum operators 498
A.5 Spins and spin-statistics theorem 503
A.6 Deflection of light in gravitational field 509

Bibliography 524
