

# CONTENTS

<i>Preface</i>	xv
<i>Introduction</i>	xvii
<b>1. Leaf Cells Consist of Several Metabolic Compartments</b>	<b>1</b>
1.1 The Cell Wall Gives the Plant Cell Mechanical Stability	5
The cell wall consists mainly of carbohydrates and proteins	5
Plasmodesmata connect neighboring cells	10
1.2 Vacuoles Have Multiple Functions	12
1.3 Plastids Have Evolved From Cyanobacteria	13
Functionally intact cell organelles can be isolated from plant cells	18
1.4 Mitochondria Originate From Endosymbionts	20
1.5 Peroxisomes Perform Fatty Acid Oxidation, Respiration, and Reactive Oxygen Species Metabolism	22
1.6 The Endoplasmic Reticulum and Golgi Apparatus Form a Network for the Distribution of Biosynthesis Products	23
1.7 Various Transport Processes Facilitate the Exchange of Metabolites Between Different Compartments	27
Translocators catalyze the specific transport of metabolic substrates and products	28
Metabolite transport is achieved by a conformational change to the translocator	30
Aquaporins make cell membranes not only permeable for water	33
Ion channels exhibit a very high transport capacity	34
Porins consist of $\beta$ -sheet structures	38
<b>2. Solar Power and Photosynthesis Are the Basis of Life on Earth</b>	<b>43</b>
2.1 The Origin of Photosynthesis	44
2.2 Pigments Capture Energy From Sunlight	45
The energy content of light depends on its wavelength	45
2.3 Chlorophyll is the main photosynthetic pigment	47
Light Absorption Excites the Chlorophyll Molecule	50
2.4 Antennas Are Required to Capture Light	54
How the excitation energy of the photons is captured in the antennas and transferred to the reaction centers	55
The function of an antenna is illustrated by the antenna of photosystem II	57
Phycobilisomes enable cyanobacteria and red algae to carry out photosynthesis in dim light	59

<b>3. Photosynthesis Is an Electron Transport Process</b>	<b>63</b>
3.1 The Photosynthetic Machinery Is Constructed From Complex Modules	63
3.2 A Reductant and an Oxidant Are Formed During Photosynthesis	66
3.3 Elucidation of the 3D Structure of a Photosynthetic Reaction Center of Purple Bacteria Was Resolved by X-Ray Crystallography	67
X-ray structure analysis	69
The reaction center has a symmetric structure	71
How does a reaction center function?	72
3.4 Two Photosynthetic Reaction Centers Are Arranged in Tandem in Photosynthesis of Plants	74
3.5 Water Is Oxidized by Photosystem II	77
3.6 Herbicides used in mechanized agriculture target photosystems	83
3.7 The Cytochrome $b_6/f$ Complex Mediates Electron Transport Between Photosystem II and Photosystem I	85
Iron atoms in cytochromes and iron–sulfur centers function as redox carriers	85
Electron transport by the cytochrome $b_6/f$ complex is coupled to a proton transport	89
The number of protons pumped through the cyt $b_6/f$ complex can be doubled by a Q-cycle	93
3.8 The Product of Photosystem I Is Reduced Nicotinamide Adenine Dinucleotide Phosphate (NADPH)	94
The light energy-driven cyclic electron transport of photosystem I produces only adenosine triphosphate	96
In the absence of other acceptors electrons can be transferred from photosystem I to oxygen	97
3.9 Regulatory Processes Control the Distribution of the Captured Photons Between the Two Photosystems	101
Excess light energy is eliminated as heat	103
<b>4. Adenosine Triphosphate Is Generated by Photosynthesis</b>	<b>107</b>
4.1 A Proton Gradient Serves as an Energy-Rich Intermediate State During Adenosine Triphosphate Biosynthesis	107
4.2 The Electron Chemical Proton Gradient Can Be Dissipated by Uncouplers to Heat	111
4.3 $H^+$ -ATP Biosyntheses From Bacteria, Chloroplasts, and Mitochondria Have a Common Basic Structure	113
$H^+$ -ATP synthase of chloroplasts is regulated by light	117
V-ATPase Is related to the F-ATP synthase	117
4.4 The Biosynthesis of Adenosine Triphosphate Depends on Conformation Change of the Protein	118
<b>5. Mitochondria Are the Power Station of the Cell</b>	<b>123</b>
5.1 Biological Oxidation Is Preceded by Degradation of Substrates to Form Bound Hydrogen and $CO_2$	123
5.2 Mitochondria Are the Sites of Cell Respiration	124

5.3	Biological Oxidation Takes Place in the Matrix	125
	Pyruvate is oxidized by a multienzyme complex	125
	Acetate is completely oxidized in the tricarboxylic acid cycle	129
	A loss of intermediates of the tricarboxylic acid cycle is replenished by anaplerotic reactions	131
5.4	How Much Energy Can Be Gained by the Oxidation of NADH?	133
5.5	The Mitochondrial Respiratory Chain Shares Common Features With the Photosynthetic Electron Transport Chain	134
	The complexes of the mitochondrial respiratory chain	136
	Electron transport of the respiratory chain is coupled to the biosynthesis of ATP via proton transport	140
	Mitochondrial proton transport results in the formation of a membrane potential	141
	Mitochondrial ATP biosynthesis serves the energy demand of the cytosol	143
5.6	Plant Mitochondria Fulfill Special Metabolic Functions	144
	Mitochondria can oxidize surplus NADH without the formation of ATP	145
	Cytosolic NADH and NADPH can be oxidized by the respiratory chain	147
5.7	Compartmentation of Mitochondrial Metabolism Requires Specific Membrane Translocators	148
<b>6.</b>	<b>The Calvin–Benson–Bassham Cycle Catalyzes Photosynthetic CO<sub>2</sub> Assimilation</b>	<b>149</b>
6.1	Carboxylation, Reduction, and Acceptor Regeneration Are Three Major Steps in CO <sub>2</sub> Assimilation	149
6.2	Ribulose Biphosphate Carboxylase/Oxygenase (Rubisco) Catalyzes Two Reactions Simultaneously	151
	There is no net CO <sub>2</sub> fixation at the compensation point	157
6.3	The Reduction of 3-Phosphoglycerate Yields Triose Phosphate	158
6.4	The CO <sub>2</sub> Acceptor Ribulose 1,5-Biphosphate Is Regenerated From Triose Phosphate	160
6.5	Reductive and Oxidative Pentose Phosphate Pathways Are Present in Chloroplasts	167
6.6	Reduced Thioredoxins Transmit the Signal “Illumination” and Activate or Inactivate Enzymes	170
	Multiple regulatory processes tune the reactions of the reductive pentose phosphate pathway	174
<b>7.</b>	<b>Photorespiratory Pathway Recycles Phosphoglycolate</b>	<b>177</b>
7.1	Ribulose 1,5-Biphosphate Is Recovered by Recycling 2-Phosphoglycolate	177
7.2	Peroxisomes Need External Reducing Equivalents for the Reduction of Hydroxypyruvate	183
7.3	Reassimilation of NH <sub>4</sub> <sup>+</sup> Released in the Photorespiratory Pathway in Chloroplasts	186
7.4	The Peroxisomal Matrix Eliminates Toxic Metabolites	188
<b>8.</b>	<b>Photosynthesis Needs the Consumption of Water</b>	<b>191</b>
8.1	The Uptake of CO <sub>2</sub> Into the Leaf Is Accompanied by an Escape of Water Vapor	191

8.2	Stomata Regulate the Gas Exchange of Leaves	192
8.3	The Diffusive Flux of CO <sub>2</sub> Into a Plant Cell	197
8.4	C <sub>4</sub> Plants Perform CO <sub>2</sub> Assimilation With Lower Water Consumption Than C <sub>3</sub> Plants	199
	The CO <sub>2</sub> pump in C <sub>4</sub> plants	201
	C <sub>4</sub> metabolism in plants of the NADP malic enzyme type	204
	C <sub>4</sub> metabolism in plants of the NAD malic enzyme type	206
	C <sub>4</sub> metabolism in plants of the phosphoenolpyruvate carboxykinase type	209
	Enzymes of C <sub>4</sub> metabolism are regulated by light	209
	C <sub>4</sub> plants have advantages in climates with higher temperatures	211
8.5	Crassulacean Acid Metabolism Allows Plants to Survive Severe Water Shortages	211
	CO <sub>2</sub> fixed during the night is stored as malic acid	213
	Photosynthesis proceeds with closed stomata	214
<b>9.</b>	<b>Polysaccharides Are Storage and Transport Forms of Carbohydrates Produced by Photosynthesis</b>	<b>217</b>
9.1	Sucrose Biosynthesis Takes Place in the Cytosol	219
9.2	The Utilization of the Photosynthesis Product Triose Phosphate Is Strictly Regulated	221
	Fructose 1,6-bisphosphatase is an entrance valve for the sucrose biosynthesis pathway	221
	Sucrose phosphate synthase is regulated by metabolites and by posttranslational covalent modification	225
9.3	Large Quantities of Carbohydrate Can Be Stored as Starch to Support Metabolism and Growth at Night	227
	Starch is synthesized via ADP-glucose	230
	Photosynthesis products can be stored temporarily in chloroplasts as starch	231
	Starch accumulation is regulated to provide carbohydrate for the plant at night	234
9.4	Degradation of starch proceeds in two different ways	235
	Assimilatory starch is degraded by a combination of hydrolytic degradation in the plastid, maltose export, and phosphorolysis in the cytosol	239
	Starch degradation is regulated by the circadian clock to ensure that plants do not starve at night	241
	Trehalose 6-phosphate is an important signal mediating the carbohydrate supply	242
9.5	In Some Plants Photoassimilates From the Leaves Are Exported as Sugar Alcohols or Oligosaccharides of the Raffinose Family	244
9.6	Fructans Are Deposited as Storage Compounds in the Vacuole	247
9.7	Cellulose Is Synthesized by Enzymes Located in the Plasma Membrane	250
	Most cell wall polysaccharides are synthesized in the Golgi apparatus	252
	Biosynthesis of callose is often induced by wounding	253
<b>10.</b>	<b>Nitrate Assimilation Is Essential for the Biosynthesis of Organic Matter</b>	<b>255</b>
10.1	The Reduction of Nitrate to NH <sub>3</sub> Proceeds in Two Reactions	255
	Nitrate is reduced to nitrite in the cytosol	257
	The reduction of nitrite to ammonia proceeds in plastids	259

The assimilation of $\text{NH}_4^+$ proceeds via two reactions of GS/GOGAT	261
The oxidative pentose phosphate pathway in leucoplasts provides reducing equivalents for nitrite reduction	262
10.2 Nitrate Assimilation Is Controlled at Various Levels	263
10.3 The End Product of Nitrate Assimilation Is a Whole Spectrum of Amino Acids	266
$\text{CO}_2$ assimilation provides the carbon skeletons for the biosynthesis of amino acids	267
The biosynthesis of glutamate requires the participation of mitochondrial metabolism	269
Biosynthesis of proline and arginine	269
Aspartate is the precursor of five amino acids	271
Acetolactate synthase participates in the biosynthesis of hydrophobic amino acids	274
Aromatic amino acids are synthesized via the shikimate pathway	277
Glyphosate acts as a herbicide in the shikimate pathway	279
10.4 Glutamate Is the Precursor for Chlorophylls and Cytochromes	280
<b>11. Nitrogen Fixation Enables Plants to Use the Nitrogen in the Air for Growth</b>	<b>285</b>
11.1 Legumes Form a Symbiosis With Nodule-Inducing Bacteria	286
The nodule formation depends on balanced bacterial and plant gene expression	288
Metabolic products are exchanged between bacteroids and host cells	290
11.2 Dinitrogenase Reductase Delivers Electrons for the Dinitrogenase Reaction	291
$\text{N}_2$ as well as $\text{H}^+$ are reduced by dinitrogenase	292
$\text{N}_2$ fixation can proceed only at very low oxygen concentrations	294
The energy costs for utilizing $\text{N}_2$ as a nitrogen source are much higher than for $\text{NO}_3^-$	296
11.3 Plants Improve Their Nutrition by Symbiosis With Fungi	296
The arbuscular mycorrhiza is widespread	297
Ectomycorrhiza supply trees with nutrients	298
<b>12. Products of Nitrogen Fixation and Nitrate Assimilation Are Deposited as Storage Proteins</b>	<b>299</b>
12.1 Globulins Are the Most Abundant Storage Proteins	300
12.2 2S-Proteins Are Present in Seeds of Oilseed Plants	301
12.3 Prolamins Are Formed as Storage Proteins in Grasses	301
12.4 Special Proteins Protect Seeds From Being Eaten by Animals	301
12.5 Biosynthesis of Storage Proteins Is Performed at the Rough Endoplasmic Reticulum	302
12.6 Proteinases Mobilize the Amino Acids Deposited in Storage Proteins	305
<b>13. Sulfate Assimilation Enables the Synthesis of Sulfur-Containing Compounds</b>	<b>307</b>
13.1 Sulfate Assimilation Proceeds Primarily by Photosynthesis	307
Sulfate is activated prior to reduction	309
Sulfite reductase is similar to nitrite reductase	311
$\text{H}_2\text{S}$ is fixed in the amino acid cysteine	312

13.2	Glutathione Serves the Cell as an Antioxidant and Is an Agent for the Detoxification of Pollutants	314
	Xenobiotics are detoxified by conjugation	315
	Phytochelatin protect the plant against heavy metals	316
	Excessive concentrations of sulfur dioxide in the air are toxic for plants	318
13.3	Methionine Is Synthesized From Cysteine	319
	S-Adenosylmethionine is a universal methylation reagent	319
13.4	Sulfate Plays an Important Role During Drought Stress	319
<b>14.</b>	<b>Phloem Transport Distributes Photoassimilates to Various Sites of Consumption and Storage</b>	<b>323</b>
14.1	There Are Different Modes of Phloem Loading	325
14.2	Phloem Transport Proceeds by Mass Flow	327
14.3	Sink Tissues Are Supplied by Phloem Unloading	327
	Starch is deposited in plastids	328
	The glycolysis pathway utilizes carbohydrates	330
<b>15.</b>	<b>Lipids Are Membrane Constituents and Function as Carbon Stores</b>	<b>335</b>
15.1	Polar Lipids Are Important Membrane Constituents	335
	The fluidity of the membrane is governed by the proportion of unsaturated fatty acids and the content of sterols	338
	Membrane lipids contain a variety of hydrophilic head groups	339
	Sphingolipids are important constituents of the plasma membrane	342
15.2	Triacylglycerols Are Storage Compounds: their de novo biosynthesis takes place in plastids	342
	Acetyl-CoA is a precursor for the biosynthesis of fatty acids	344
	Acetyl-CoA carboxylase is the first enzyme of fatty acid biosynthesis	345
	Fatty acid biosynthesis is catalyzed by a multienzyme complex	347
	The first double bond in a newly synthesized fatty acid is introduced by a soluble acyl-ACP-dependent desaturase	350
15.3	Glycerol 3-Phosphate Is a Precursor for the Biosynthesis of Glycerolipids	353
	Triacylglycerol biosynthesis	355
	The endoplasmic reticulum membrane is the site of fatty acid elongation and desaturation	357
	Some plastidial membrane lipids are synthesized via the eukaryotic pathway	357
15.4	During Seed Germination Storage Lipids Are Mobilized in the Glyoxysomes for the Production of Carbohydrates	360
	The glyoxylate cycle enables plants to synthesize hexoses from acetyl-CoA	362
	Reactions with toxic fatty acid intermediates take place in peroxisomes	364
15.5	Specialized Fatty Acids and Derivatives	365
	Plant fat is used for human nutrition and also as a raw material in industry	368

<b>16. Special Metabolites Fulfill Specific Biological and Ecological Functions in Plants</b>	<b>373</b>
16.1 Specialized Metabolites Often Protect Plants From Pathogenic Microorganisms and Herbivores	373
Plants protect themselves by tricking herbivores with false amino acids	374
Pathogens produce aggressive compounds to ensure their survival	375
16.2 Plants React to Pathogen Attack by the Release of Immunomodulatory Agents, Phytoalexins, and Phytoanticipins	376
16.3 Degradation of Cyanogenic Glycosides Releases Toxic Hydrogen Cyanide (HCN)	380
16.4 Glucosinolate Degradation Releases Toxic Volatile Mustard Oils	383
16.5 Alkaloids Comprise a Variety of Heterocyclic Specialized Metabolites	386
16.6 Transport, Storage, and Turnover of Specialized Metabolites	388
Plant defense compounds can also be a risk to humans	389
<b>17. A Large Diversity of Isoprenoids Has Multiple Functions in Plants</b>	<b>391</b>
17.1 Higher Plants Have Two Different Biosynthesis Pathways for Isoprenoids	393
Acetyl CoA is a precursor for the biosynthesis of isoprenoids in the cytosol	393
Pyruvate and D-glyceraldehyde-3-phosphate are the precursors for the biosynthesis of isopentyl pyrophosphate in plastids	395
Prenyl transferases catalyze the fusion of isoprene units	396
Some plants emit isoprenes into the air	398
17.2 Monoterpenes Derive From Geranyl Pyrophosphate	399
17.3 Farnesyl Pyrophosphate Is the Precursor for the Biosynthesis of Sesquiterpenes	400
Steroids are synthesized from farnesyl pyrophosphate	402
17.4 Geranylgeranyl Pyrophosphate Is the Precursor for Diterpenes and Polyterpenes	404
Carotene biosynthesis	405
A prenyl chain renders compounds lipid soluble	407
17.5 The Regulation of Isoprenoid Biosynthesis	409
Isoprenoids are very stable and persistent compounds	410
<b>18. Phenylpropanoids Comprise a Multitude of Plant-Specialized Metabolites and Cell Wall Components</b>	<b>411</b>
18.1 Phenylalanine Ammonia Lyase and Monooxygenases Are Involved in the Biosynthesis of Phenolic Compounds	411
18.2 Phenylpropanoid Compounds Polymerize to Macromolecules	417
Lignans act as defense substances	417
Lignin is formed by radical polymerization of phenylpropanoid derivatives	419
Suberins and cutins form gas- and water-impermeable layers of cells	421
18.3 The Biosynthesis of Flavonoids and Stilbenes Also Requires Acetate for Aromatic Ring Formation	422
Some stilbenes are very potent natural fungicides	423
Flavonoids have multiple functions in plants	423

20.4	The Mitochondrial Genome of Plants Varies Greatly in Size	494
	Male sterility of plants caused by a mitochondrial protein is an important tool in hybrid breeding	497
<b>21.</b>	<b>Biosynthesis, Processing, and Degradation of Plant Proteins</b>	<b>503</b>
21.1	Protein Biosynthesis Is Catalyzed by Ribosomes	503
	A peptide chain is synthesized	507
	Specific inhibitors of the translation can be used to decide whether a protein is synthesized in the cytosol, plastids, or mitochondria	510
	The translation is regulated	512
21.2	Proteins Attain Their Three-Dimensional Structure by Controlled Folding	513
	The folding of a protein is a multistep process	513
	Heat shock proteins protect against heat damage	516
	Molecular chaperones bind to unfolded proteins	516
21.3	Nuclear-Encoded Proteins Are Targeted to Various Cell Compartments	519
	Most of the proteins imported into the mitochondria must cross two membranes	520
	The import of proteins into chloroplasts requires several translocation complexes	523
	Protein import into peroxisomes	525
	Nuclear localization signals direct protein import into the nucleus	527
21.4	Proteins Are Degraded by Proteasomes in a Strictly Controlled Manner	528
<b>22.</b>	<b>Biotechnology Alters Plants to Meet the Requirements of Agriculture, Nutrition, and Industry</b>	<b>533</b>
22.1	A Gene Is Isolated and Archived in a Gene Library	533
	A gene library is screened for a certain gene with DNA probes, antibodies, transposons, or T-DNA	537
	Genes encoding unknown proteins can be functionally assigned	542
22.2	DNA Polymorphism Yields Genetic Markers for Plant Breeding	542
	Individuals of the same species can be differentiated by restriction fragment length polymorphism	544
	The random amplified polymorphic DNA technique is a simple method for investigating DNA polymorphism	547
	The polymorphism of microsatellite DNA is used as a genetic marker	549
22.3	Agrobacteria Can Transform Plant Cells	549
	The Ti-plasmid contains the genetic information for tumor formation	551
	Ti-plasmids are used as transformation vectors	553
	Plant cells are transformed by the uptake of DNA	554
	A new plant is regenerated from callus tissue	557
	Selected promoters and reporter genes enable defined expression studies of foreign genes	558
22.4	Several Techniques Are Available to Turn Off Genes in Plants; CRISPR/Cas Is the Most Efficient Genome-Editing Strategy	560

204	<b>22.5</b>	Plant Genetic Engineering Can Be Used for Many Different Purposes	564
		Plant protection via Bt protein	565
		Plant protection against viruses	566
		Fungus-resistant plants	567
		Herbicide-resistant plants	567
		Improvement of yield and quality of crop products	568
		Renewable resources for industry	568
		Protection of crop plants against environmental stress	569
