<b>Part I Introduction</b>	<b>1</b>
<b>1 Introducing the thought experiment</b>	<b>3</b>
1.1 The entangled bank	3
1.2 The entity approach	3
1.3 A process-based approach	5
1.4 The Gaian effect	8
1.5 Overview	10
<b>Part II The Fundamental Processes</b>	<b>11</b>
<b>2 Energy flow</b>	<b>13</b>
2.1 The second law of thermodynamics	13
2.2 Schrödinger, entropy, and free energy	14
2.3 Sources of free energy	17
2.4 Maximum entropy production and planetary ecology	17
2.5 Overview	18
<b>3 Multiple guilds</b>	<b>19</b>
3.1 The importance of waste	19
3.2 The requirement for multiple guilds	21
3.3 Predators and parasites	22
3.4 Parasites introduce a potentially important mechanism for density-dependent regulation	24
3.5 Other effects of parasites	28
3.6 Overview	29
<b>4 Trade-offs and biodiversity</b>	<b>31</b>
4.1 The problem of biodiversity	31
4.2 Trade-offs illustrated by human sporting performance	33

4.3 Trade-offs in ecology	35
4.4 Trade-offs and biodiversity	38
4.5 The Gaian effect of biodiversity	39
4.6 Overview	43
<b>5 Dispersal</b>	<b>45</b>
5.1 Tansley's beechwoods	45
5.2 The evolution of dispersal	46
5.3 Dispersal as a key process in ecology	47
5.4 Dispersal at an astronomical scale?	50
5.5 Overview	52
<b>6 Ecological hypercycles: covering a planet with life</b>	<b>53</b>
6.1 Darwin's earth worms	53
6.2 Hypercycles in ecology	53
6.3 Covering a planet with life	56
6.4 Why would persistent restricted ecologies be unlikely?	57
6.5 The end of life on a planet	59
6.6 Overview	61
<b>7 Merging of organismal and ecological physiology</b>	<b>63</b>
7.1 From beavers to planetary ecology	63
7.2 Daisyworld	64
7.3 Examples of the role of life in planetary physiology on Earth	66
7.4 The importance of biomass: an illustration from Earth's past	70
7.5 Biomass and Gaia	71
7.6 Overview	72
<b>8 Photosynthesis</b>	<b>73</b>
8.1 Quantification and mysticism in the seventeenth century	73
8.2 The diversity of photosynthesis on Earth	73
8.3 Photosynthesis and the Earth system	76
8.4 Oxygen and the Earth system	77
8.5 Is photosynthesis a fundamental process?	82
8.6 Overview	83
<b>9 Carbon sequestration</b>	<b>85</b>
9.1 Carbon sequestration and landscape change in northwest England	85
9.2 A tale of two cycles: short- and long-term carbon cycles	86
9.3 The role of life: from geochemical cycles to biogeochemical cycles	88
9.4 Co-evolution of plants and carbon dioxide on Earth	91
9.5 Oxygen and carbon sequestration on Earth	92
9.6 Humans and carbon sequestration	92
9.7 Carbon sequestration as a fundamental process	97
9.8 Overview	98

<b>Part III Emerging Systems</b>	<b>99</b>
<b>10 Nutrient cycling as an emergent property</b>	<b>101</b>
10.1 The paradox of the goldfish	101
10.2 Trade-offs and <i>in vitro</i> evolution	101
10.3 Emergence of biogeochemical cycles	103
10.4 Cycling ratios and biotic plunder	104
10.5 Overview	105
<b>11 Historical contingency and the development of planetary ecosystems</b>	<b>107</b>
11.1 Carus and the thunderbolt: chance and change in history	107
11.2 Historical contingency and ecology	107
11.3 Historical contingency and the Earth system	109
11.4 Overview	111
<b>12 From processes to systems</b>	<b>113</b>
12.1 An Earth systems approach to ecology	113
12.2 The trouble with Gaia	115
12.3 Selection for Gaia?	115
12.4 Conservation biology and the Earth system	118
12.5 Concluding remarks	120
Glossary	123
The geological timescale	127
References	129
Index	147
